>for a Falcon to connect it to Ethernet networks..

Well, I'm not too sure what the answer to your question is, but I can tell you
that I use a (second) MIDI interface designed for the MAC (it's called the
MIDIman "MACman MIDI Interface") that connects to the Falcon's LAN port and
gives me an extra 16 MIDI channels for use with Cubase Audio.

So, since a MAC-designed piece of hardware works with the Falcon LAN port,
perhaps it is also AppleTalk compatible and what you describe would work as
well...

I don't see why not, but some MegaSTE also had an internal SCSI
interface, so you could also connect your drive internally.

> Which is better the TT030 or the Falcon?

TT is really fast, comes with a 68882 FPU by standard, has internal
SCSI controller plus a connector for external devices.
It was mainly designed to replace the MEGA-ST in hi-end DTP duties,
but also makes a potent UNIX worksation.

Falcon is slower, the FPU is optional and its SCSI-2 implementation
is horribly bugged. However, it has a built-in DSP which some apps
use to great results for graphic rendering or digital recording.
It was mainly designed as an STE replacement.

See http://www.megacom.net/~q-funk/TT030/
for more details about the TT.

[kfs.org, Kingfisher Software, and John Gymer]

Just for the record (and since by some bizarre coincidence I find myself searching for the word "Gymer" on Deja News!), they are all related.

KFS.org was created by Oliver Smith. Oliver and John were friends years ago when they both lived in and around Grimsby. John is the same John Gymer that worked for HISOFT and created Canvas and Concerto (one of which was written for his A-level Computing project - Canvas, I _think_).

I'm John's older brother, so I should know. :-) Happy days, they were...

None of us use STs any more (although I've still got two); you can contact John at jgymer@iet.co.uk and tell him how wonderful Concerto is if you like!

The most annoying difference between the TT and the Falcon are ALSO:

Falcon doesn't have ASCI and second floppy drive outputs anymore !

This can be really annoying if you had an Atari laser printer and a
second floppy drive ...
The TT has both ASCI and SCSI ports and stays with the second floppy
drive output !

10. Free Pascal

Newsgroup: comp.sys.atari.st
Date: 1998-10-01 00:00:00 UTC
From: codc01@gel.usherb.ca
Message-ID: <6v0c1c$3qe$1@nnrp1.dejanews.com>
Source record: 92701

Greetings,
The first version of the Free Pascal compiler for 680x0 targets is now
available on most Free Pascal official sites. Currently available are:

- Cross development environment for AmigaOS on linux-i386
- Cross compiler for Atari TOS on MS-DOS
- Native AmigaOS Free Pascal compiler

These compilers are based on Free Pascal 0.99.5c, this revision has not been
released for the x86 but is similar in effect to Free Pascal version 0.99.5
except that all known code generation bugs known from FPC 0.99.5 have been
fixed.

You can get the compilers at:
ftp://tflily.fys.kuleuven.ac.be/pub/fpc/dist/

Help is required to port to other 680x0 operating systems:
- Atari native TOS port
- Linux-m68k native port
- Macintosh port help

Please if you can help, contact me via *e-mail*, i would do this port myself,
but i do not have access to these operating systems.

Well, except for laser printers, ACSI was more or less a dead standard
as soon as they introduced SCSI. But you're right if you own one of
those, it's pretty nice to be able to use it ;-)

What's the use of a second floppy drive when you have a HD ?

Cheers,
Nick

Okay folks, I have a SCSI question..

the situation: I have a Falcon with 14 meg of ram, a FPU, and a
quantum lightning 720, running neodesk and geneva (for now).

the problem: Just got ahold of a quantum 4.3 gig Fireball ultra scsi
drive with a 50 pin connector.. Falcon doesn't seem to recognize it.

Any suggestions?

and if it turns out to be the scsi drive, what brand/model of
CURRENTLY available SCSI drive would you recommend?

Thx,

Bill

I didn't know the editor and viewer could cause problems. It makes me wonder about a problem I have. I write mail using Everest, and it writes and sends OK. But if I choose to view it in the internal viewer, the message gets garbled. I don't know about incoming mail, because I'm setting up the system for a friend in another town, and at present she hasn't got the kyestorkes right to get mail, and I'm not there to advise her.

21. Re: Bad AUTO folder programs

Newsgroup: comp.sys.atari.st
Date: 1998-10-01 00:00:00 UTC
From: "Jeffrey S. Jewell" <jjewell@ix.netcom.com>
Message-ID: <3613BF7C.C551DD02@ix.netcom.com>
Source record: 92712
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

Thanks everyone for the suggestions. This is what I've got so far:

I'm using a Mega 2 ST with an older TOS (not sure which) and a homebrew hard drive using ICDs Host Adapter and their autoboot software 4.8.4.

Holding down Control, Left-Shift, or Right-Shift on bootup seems to do nothing different, the autoboot software runs and runs the AUTO folder items, resulting in the 2 bomb crash described below.

Booting the computer with the hard drive powered down allows me to get to a desktop, but powering up the hard drive results in weird floppy response. Most importantly, any program I try to run from floppy (like a hard disk driver) gives me TOS Error #35 (the floppy also will no longer identify disk swaps, even if I look at Drive "B:", TOS asks me to put disk B in Drive A:, but it will show the directory of whatever disk was in A: when the hard drive was powered up).

Any more ideas or suggestions? I have a 520STfm and two 1040STfs if it might help to connect the hard drive to a different machine for some reason...

Thanks again for all the help,

Jeff

> >unsure.

MP3 files can be either MPEG-1, MPEG-2 or MPEG-2.5 Layer III audio
files. The audio compression is similar in the three, but there are
some different variaties of the format.

> Well, I tried playing an mp3 using an mp2 player on the Falcon, and it didn't
> recognize the file. I also tried renaming the mp3 to an mp2 file which also
> didn't work (I didn't think it would but figured there was no harm in trying!)

If you're trying on our player, MP2AUDIO, it doesn't check the
filename, but the header code which the MPEG audio file starts with.

> I've asked here, but so far no one has been able to explain the difference
> between an mp2 and an mp3 file. If the Falcon can do multiple AIFF files
> (with Cubase Audio) and mp2 files, not to mention MOV and AVIs with ANIplayer,
> I'm sure it could do mp3s. Isn't it just a slightly different compression
> scheme than an mp2?

No, the name confuses people to think it's similar. Well, in a way it
is, because the idea behind it is similar. That is to divide the
frequencies into smaller subband, remove those with no sound, combine
some with almost the same amplitude, and some other things. All to
remove sound that the human ear can't hear anyway. To a limit of
course, which is what the bitrate decides, higher bitrate, better
quality.

MP3 has more complex ways to choose subbands, where MP2 has 32 static
ones, MP3 can variate the number and length of them, going on what
suits the current piece of music best. MP3 also includes huffman
decoding using specialized huffman codes, which are in quite large
tables. Thirdly, it has a special mode to combine the two channels to
save memory.

Bottom line, after all this technical mumbo jumbo, is that it's much
slower to both decode and encode MP3 compared to MP2.

> A side note: Does anyone know of a PC/windows program that will convert an
> mp3 to another format (ie. mp2, WAV, AIFF)? My roomate has a PC, and if he
> can convert them to a useable (Atari) format, that would work too.

AFAIK, there are no direct converters between mp3 and mp2, but you
would have to take a decoder and make a sample of it and then encode

it as mp2. Your roommate should be capable on doing this on his PC.

What this comes down to, is that many people want a player for Falcon, almost as many think it's possible, and some even think it's easy to make one. But nobody is willing to try, it seems. I've tried, and gave up. It might've been that I choose a bad C source to convert, amp player, or I didn't try hard enough. Most people are blaming it on that they don't know the DSP. Well, learn! It's really not that difficult.

I do believe that it's possible, mainly because I think everything is possible. :) But, I also think that it would take quality reduction to be able to play it in real time on the Falcon. I don't know enough sound processing to know how to do this though.

http://www.mpeg3.com and http://www.mp3.com might contain some more information for you on the subject.

I'd be happy to talk to others who have been, are, or want to seriously try to make a player.

I've had this. Forget how it all came about but the problem will be
that Magic does not know what to run after initialising.

Check your MAGX.INF is readable and make sure that the path to the
desktop is not corrupted. If you want to re-install anything then try
all the MAGXDESK components.

You could try selecting MAGXDESK.APP if it gives you the file selector
again as this (or Thing or Jinnee) is the sort of program it's looking
for.

Hi Jeffrey!

I am sorry:
None of the tips so far will surely help you in each case.
Under normal circumstances your hard disk driver (AHDI or HDDRIVER) allows you to boot from floppy by holding down the ALTernate key after the floppy LED has flashed up until it boots from flopy disk, no matter which TOS version you have.

(Supposed you have an internal hard disk. Otherwise you simply could turn the drive on _after_ booting and starting the hd driver manually.)

Hope this helps.

Carsten

Look on the Atari side. gemsys\magic\xtension. That's is the place of
keytabls.sys.
This is a small file which holds the keyboard layout.
I don't know anything about keytabls.swg

>Well, except for laser printers, ACSI was more or less a dead standard
>as soon as they introduced SCSI.

Well you are quite right, but I'm really glad to have this ASCI port
because when a member of my club comes home and he wants to clean his
good old ASCI atari drive, I'm always able to help him ... And above
all I like to use my good old SLM 605 ... which I now know very well ...
I have absolutely no reason to move to another ... it's fast and print
quite nicely for its age.

>What's the use of a second floppy drive when you have a HD ?

Being used to use two drives is really nice because you don't have to
swap between disks during copy operations ... believe me, when you use
two drives, it's always sad to abandon the second one ... this is
absolutely no luxe !!!!!!!!

In fact I hate Falcons :)
They are slow and have an espescially bad designed plastic box : the
same STF and STE did :(... I hate to connect and disconnect
mouse/joysticks plugs from these very bad designed boxes !!!!!!!!!!

But, Yes, I know I have put my TT030 in a "WoodTTower" which can be seen
at http://ping4.ping.be/dipching-drulkhor/HARSOF-E.HTM for curious
people ... there was not enough room inside the genuine box to put all
the extensions ... and after all I decided to do that after my power
supply went out of work.

Jo

When you have a TT030 graphic card equiped you cannot imagine to go to
a Falcon ... the only drawback is the DSP, but when the hell do you
need a DSP ? Graphics ? Music ? I have absolutely no regret to own
today two graphic card equiped TT030s ...
This is the best beast after Milan, Medusa and Hades ...
But they have yet to prove their reliability ... any TT030 is far more
compatible than them, well ... until I will see the Milan at Neuss
Saturday ..... ;)

I wonder how many other's are fighting with this :-)

I borrowed access to a PC and managed to register myself with the freeserve.

Came back to my Atari and tried to set up a STiNG dial script to get access. All works fine until the PAP authentication when I get 'Authentication failed'.

Hmm ... anyone know how freeserve construct the PAP_ID (I have just used my domain name) and whether the PAP password is the same one I use at log in?

31. AUTO folder redirection?

Newsgroup: comp.sys.atari.st
Date: 1998-10-01 00:00:00 UTC
From: xlator@cix.compulink.co.uk
Message-ID: <F05z2v.I9p@cix.compulink.co.uk>
Source record: 92722

HI all!

Anyone know of a program that would redirect screen output during booting from the AUTO folder to a file or a window? I want to intercept the error messages that NVDI puts up for faulty fonts - there are so many that they scroll off screen before I can read them. I can't even pause the output with a Control-combination. I know that redirection is possible for normal TOS programs (?WinX? and VT52?) but can one be run from the AUTO folder and work immediately for following AUTO programs?

If not I guess I'll have to upgrade to NVDI 5, which I gather has options of a log file that would contain this info.

Regards
Peter

A similar effect in 0.92- selecting an article mentioned in the
overview and getting a blank screen- appears to be due to two index
entries for the same article. I read the article from the first entry
and delete it, and the second entry then gives a blank page. It deletes
OK though, which it wouldn't in 0.90. It seems to occur most often with the
last article read in a newsgroup for offline reading.

Same here. Setting the last character timeout to 5 seconds has halved my
on-line time.

Me also: why can't those shops be simple 'HONEST' when selling
software? They would not try to sell not-autorized copies of Windows:
a flock of layers would descend on them!!!
Simply tell me:
When you are a small 1-person auteur/software maker how can you get
payed for your copyright?
If a shop in de USA simply does not pay you or dishonestly sells more
then they tell you, what can you do?
Find proof? Hire detectives? Use lawyers? Go to court?
And that for amounts maybe less than 1000 dollar?
Legally you are totally vunerable as a person without 'big money'.

This is not only when things happen in the USA for us Europeans but
also the other way around:
one there was a Dutch firm that sold here Gemulator (as official
dealer) with the hardware that was not made in Canada. Can the maker
in Canada of Gemulator be sure now that he indeed recieved all his
money he has due rights on? Would law-suite be feasable?

Hi,

I agree with the use of a 2nd floppydrive, but the ACSI use may be a dead
standard, with a Link or something alike (which I use on the old ST) I can
hook up 14 devices to my TT...! 7 on the SCSI port and another 7 on the
ACSI.
Tell you the truth: I always have considered the Falcon as a non-finished
piece of hardware, incomplete etc. Probably because of the hurry they
wanted to launch it, and at the time it was launched nearly the whole
market for it had been taken by Amiga. One of the MAJOR reasons (IMO) why
Atari did not make it in the end: lack of a good marketing plus a major
lack in organising their logistics. They had fancy hardware, far ahead in
its time (remember the CDAR 504 - if I recall correctly -, they just
launched it too early, no-one saw a use for such a thing; nowadays it's
the standard outfit on any machine, the iMac hasn't been fitted with a
floppydrive...)

>>
Alan, that is logical: both entries probably refer to the same file, so if
you delete that file the second entry can't find it any longer and thus
displays a blank page :-)
It must be the "double-fetched articles".
>>>
> Same here. Setting the last character timeout to 5 seconds has halved my
> on-line time.
>
Yup, but beware for FTP-ing (or browsing) with such a setting: doesn't
work too well :-)

BTW: ATM I only use Newsie (0.92) for online work, I've got Okami as the
regular newsreader and am still evaluating FireNews for a mag here, but I
think the online features of Newsie are unmatched.
What I really like to see (especially if one uses Newsie for offline) is
to have an option "no logging at all". I repeat this again, I think all
the bloody corruption has to do with the log file. There must be some
improper coding for that part... The problem is, you can minimize the
logging but you can NOT turn it off completely.

Agreed - but the usefulness of an Internet access account and a POP3 box becomes apparent when you are abroad and want to check your email.

It is very important for me to have a POP3 box which is accessible via any internet access I can get - for eg, I have about 3 POP3 boxes and one IMAP mail box... plus, I receive all my faxes via email now (thanks to JFAX) and in the same way, I receive all my voice-mail/answer-phone messages via email too (in pure sound - again thanks to JFAX).

If I had to connect via my ISP all the time to retrieve my email it would kill me in access fees...

I'm thinking of the usefulness of the Internet account as it relates to me... :)

Hi

I have gone back to 0.90 for the same reason, I'm not using wdialog, I am using Everest as the text editor, my STE is single TOS - 2.06, but with Veloce+ and so 68020.

I've had no problems with .STX files and since 0.90 no problems with the Cache.dns nor with files being corrupted.

I have to admire John's determination and patience, every time he improves the program still further something else swings in from the midfield!

Regards

Trevor

>You could try selecting MAGXDESK.APP if it gives you the file selector
>again as this (or Thing or Jinnee) is the sort of program it's looking
>for.

Thanks for your replies.

Before I recopied the whole C:\ partition from a backup, I of course, first tried selecting and running MAGXDESK.APP, but that didn't work (it gave me an error message). Then, I tried copying all the MagiC-related stuff, including the entire GEMSYS, GEMDESK, and MAGIC directories and all included files, as well as MAGX.INF from a recent backup. This didn't solve the problem either as the file selector still came up at the end of the bootup cycle.

I then copied (from a backup) my AUTO folder and ACCs. Problem still there.

So, I recopied (from a backup) the entire C:\ partition. Problem still there.

That's when I went to a slightly earlier backup of C:\, and it finally worked. So whatever corrupted the original MagiC file(s) was also in the most recent backup. Anyway, all is well now, and I'm certainly glad I had a second backup! :~)

And if this should happen again, at least now I'm a little more "informed" about what's going on...

Thanks!

The mp2 player I've used is:
"mp2 version 0.4alpha, Copyright (C) 1996 Fredrik Noring"

[snip]

>Bottom line, after all this technical mumbo jumbo, is that it's much
>slower to both decode and encode MP3 compared to MP2.

I'm not certain I see the point in all of this. I don't really notice much
of a difference in sound quality between an mp2 and an mp3, or an AIFF file if
they're all recorded at the same sample rate and frequency. In other words,
there doesn't seem to be any real benefit to using mp3 over the others.

>AFAIK, there are no direct converters between mp3 and mp2, but you
>would have to take a decoder and make a sample of it and then encode
>it as mp2. Your roommate should be capable on doing this on his PC.

It wouldn't necessarily have to convert it to an mp2. I would actually prefer
an AIFF or WAV.

>What this comes down to, is that many people want a player for Falcon,

>be able to play it in real time on the Falcon. I don't know enough
>sound processing to know how to do this though.

Well, I'm not really a programmer (except for some stuff on the old Atari 8-
bits), so I'm not the one to do it!

Oh well, all these little things like mp3s, real audio, shockwave, JAVA, etc.
etc. that Ataris supposedly "can't do" are really starting to make me feel
like abandoning (the Atari) ship. I've been with Atari a long time, and have
a substantial investment in hardware and software, but it appears that more
and more things are out of reach with an Atari, and that doesn't look like

it's going to change either. My roomate used to use an STE, now he's got a PC (mainly for Cubase VST / Rebirth - which are incredible programs). And one of the semi-regular posters here, and a friend of mine, Mark Simpson has just recently gotten a MAC, and he's amazed at all the things he can now do easily that he was struggling with on his Falcon and TT.

I still find my Falcon incredibly useful (Cubase Audio was the main reason I bought it though), but the grass looks greener on the other side every day...

Hi Michael and others,

For what it's worth... I've had several email communications with John Perez in the past, mostly about SCSI questions, and Logic Audio related issues. He was always VERY prompt in answering my questions and often went into lengthy explanations, being extremely helpful. He always took the time to answer my questions and help out a fellow Atarian - well, at least in MY experience. John didn't seem to me the kind of person to do the things mentioned, but that's only MY experience.

I'm sorry to hear about the problems you've had, and I really hope things are worked out to everyone's satisfaction.

Striving for peace in the Atari community,

Source record: 92760
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

I don't remember my STs as well as I thought...

After getting back from WOA '98, I tried to install some new stuff in my auto folder on my C:\ drive. The computer boots, gets to two bombs, and I end up looking at a desktop with a mouse that moves but can't click on anything.

I think I just need to get the ST to bypass the AUTO folder, but I can't remember how to do that, and I couldn't put my hands on the right manual...

Any quick help for a guy who should have known better?

Thanks,
Jeff

61. New MyMAIL version

Newsgroup: comp.sys.atari.st
Date: 1998-10-01 00:00:00 UTC
From: epkerha@epk.ericsson.se
Message-ID: <6uv5uj$luu@newstoo.ericsson.se>
Source record: 92764

```
Hi all !

Now its time again for a new MyMAIL version
This time it got rev nr 0.69

This time there is lots of bugfixes.

Bugfixes and new things
-----------------------

**** 01.10.1998 ****
Rev: 0.69

- Fixed problems with locked buttons in "Timer dial" window.
- Delete key was not working in object edit fields.
- It is now possible to select next or prev. message
from a mail read window.
- There is 5 new icons in read mail window.
Upp arrow icon - selects prev. mail
Down arrow icon - selects next mail.
Info icon - shows info about the mail. (Mailer, from, to, ....)
Printer icon - print the mail
Disk icon - save mail text to file
- Save mail to text file was not working if ram disk was installed
Now it works with ram disk.
- Fatal error found in address field
if no alias file existed the field was cleared at enter.
This is now fixed.
- A small assembler bug fixed in string copy functions.
- Added save mail as html.
This function is very simple and
no special chars are converted in this version.
There is 2 versions.
* Save mail as HTML - Saves/converts one selected mail into one file
specified by the user.
* Save all mail as HTML - Saves/concerts all mail into a directory specified by the user
mail 1 is converted to file 1.htm
mail 2 to 2.htm and so on.....
Then there is a file index.htm created
with links to all the html-mail files.
- Bugfixes in editor.
* Randomly was wrong number of chars copy to clipboard
This is now fixed.
* Too slow adding of new line.
this is now done faster.
* Randomly was bad chars inserted in text when moving cursor with arrow keys.
```

This is now fixed.
* Home key is now working correctly.
* Ctrl-C, Ctrl-v and Ctrl-x was inserting the control chars in text buffert
causing strange functionality of the editor.
* If there was only one cr/lf in text buffert
and user pressed Delete key then only the cr char was removed.
This is now fixed.
* It was possible to delete chars from empty textbuffert
this was causing starnge results.
This is not possible now.
* Internal fault:
If block bigger than text buffert was deleted
then the program crasched.
* Trying to delete the last char and in text buffert
and the char is a cr/lf combination only the cr was deleted.

- Bugfixes in filter functions.
- Dilaer communication bugfixed.
KRfree was called randomly with a faulty pointer.
- Added abort function to the dialer function in mymail
it will only abort mymails communication and will not send any
abort messages to the sting/stik dialer.
- Internal buffert for clipboard was too small
this is now 20K
- Bugfixes in "Receive mail details".

You can download from this address:

Videlity is a commercial program obtainable from Titan BSS - it does the
same job as Videl Inside AFAIK so there's no particular advantage.

ISTR that Warp 9 had some compatibility problems. NVDI would be my
recommendation as it will also give much better font support.

I came across a Falcon mod the other day which describes fitting a pixel
clock inside the case (it's a plain TTL oscillator, just 3 wires to connect
and no traces to cut) which has the advantage of allowing access to video
modes that otherwise depend on Nemesis speed - anyone who's dropped Nem. to
low or off with a custom res. in use will know what I mean...

My only problem with aFTP is that if I've run it, put it to the background
and then clicked its Appline button to top it it always crashes with an
exception error.

I can agree with what you say above. Maybe I even spent a little more
time communicating with him. Unfortuantely, what seemed to be on the
surface didn't reflect what was actually the situation, as I
understand it. A dropped ball sometimes hits the foot and doesn't
bounce back to remind one which way on the court they were headed.
I think this was the case.

>
> Just an observation

Yup.

Both http://sme.eunet.be and http://sme.eunet.be/ are valid URLs, and they both mean the same thing: connect to port 80 of sme.eunet.be and fetch the document called "/". So probably CAB quietly converts the first form to the second as soon as it gets it, to simplify later processing.

OTOH http://sme.eunet.be/kalliope is *not* a valid URL (as it happens): if you type that in then CAB will connect to port 80 of sme.eunet.be and try to fetch the document "/kalliope", but when the server tries to map that onto a filename it finds not a file but a directory! Aha, thinks the server, chances are silly sod forgot a slash: so it responds with the information that http://sme.eunet.be/kalliope has moved (permanently) to http://sme.eunet.be/kalliope/ . CAB then updates the entry in its hotlist and makes another request to sme.eunet.be:80, this time for "/kalliope/"; which succeeds, because there is a file in that directory with a filename which the server recognises as a "default document". (IIRC it is "index.html", although it could be "quux.pl" if the webmaster wanted it to be).

Just an education in WWW mechanics. :)

I have not heard about this. The thing is that I'm so used to Lattice
so changing compiler is not something I realy want. If I'm going
to change it will be to GCC but as far as I know there is no realy
nice environment for GCC (editor with error "tracking", project
manager etc.). Okey it's not such a big problem under a multitasking
system, but it's so nice with a nice working setup.... The main
problem I have with Lattice is the editor. The block handling is
realy no standard....

Well it's very nice to atlast have someone from HiSoft telling us
something which with a bit of luck could be of good to us....

So maybe there is hope for us to atleast do some bargins in the
future. New updates software wouldn't be to bad either.... like
Papyrus 7 which is on it's way and other smaller packages as well.

Hi Jeffrey,

You could try booting from a floppy, then running your hard disk driver program manually (assuming you have it backed up onto a floppy). Then mount the C: drive on the desktop and delete the offending items from the Auto folder.

As far as I can remember you have a couple of options.

1. Hold down left or right shift (I think) while booting.

2. Boot up with a blank disc.

After this, run the HD driver program (whichever one you are using) from your original installation disc to mount the hard drive. Rename all the new programs (to *.prx or something), reboot and it should still go. Then try enabling them one at a time to find the culprit, rebooting each time.

root <netman@cyberramp.net> wrote:

> Which is better the TT030 or the Falcon?

That depends on what you're going to use it for.

TT: Faster (twice as fast), very reliable, rock-solid SCSI, external, superb keyboard, dull graphics (640x480x16 colours) and sound (same as STE), can be upgraded to 256Mb or more.

Falcon: Slow, poor SCSI, STE-case, OK (but slow) graphics (256- and 16-bit modes), great sound with direct-to-disk and DSP.

The Falcon really needs to be upgraded with an Afterburner or CenTurbo2 (I've never seen a CT2 but it looks very promising) to be really useful, as it has a slow CPU, slow 16-bit bus and is limited to 14Mb. The TT is very good "as is", atleast I'm very satisfied with mine even though I also have a Falcon with Afterburner and graphics-card.

IMHO is the TT the most ST-compatible of the two.

75. NEWSie LOG File

Newsgroup: comp.sys.atari.st
Date: 1998-10-01 00:00:00 UTC
From: ecncomr@socal.com
Message-ID: <6uvdc9$ber@enews4.newsguy.com>
Source record: 92778

I just noticed that despite having all LOGging functions of NEWSie de-activated in version .92, NEWSie will still (occasionally) create a LOG file in my WORK directory. After seeing this, I ran Diamond Edge to check for lost clusters etc, but none appeared. I do however, remember NEWSie version .88 also creating this LOG file from time to time (even with LOGging de-activated), and when I ran Diamond Back III for a routine backup of that partition, the program couldn't copy that LOG file - as if there was something wrong with the file itself. It was deletable though.

But so far, with version .92 of NEWSie, I haven't experienced any lost clusters or other HD errors. And my STinG (.STX) files haven't become corrupted yet. And the correct article number appears to be saved when downloading newsgroups for offline reading.

I also haven't experienced any lockup of NEWSie after reading e-mail or newsgroup articles. But then I always "disconnect from server" and quit the program (and re-run it) before trying to read any newsgroup articles that were downloaded for OFFLINE reading.

For the record, I'm running NEWSie .92 on a Falcon030 (standard with 14megs RAM under MagiC 5.11).

>thing after reading and posting with the newsgroups too. So to
>make sure things work right, mostly I'll stick with .88!

Well, I remember right after I got the commercial version of CAB from Systems For Tomorrow (version 2.5) I installed WDIALOG so that I would be able to use GEMjing, since at the time, I hadn't yet started using MagiC - I was still running TOS 4.04 on my Falcon.

Anyway, WDIALOG made all the CAB 2.5 icons look like the icons from the early version of CAB (1.5). As a result, I thought my 2.5 had somehow reverted back to some sort of demo version or something. That is, until I found a little blurb in the CAB manual about older versions of WDIALOG causing this problem with CAB. But, regardless of which version of WDIALOG I use now, it still does this to the CAB 2.5 icons. But, since I started using MagiC 5, I haven't even loaded WDIALOG, and I don't feel I'm missing anything.

As far as what WDIALOG actually does, I've never been 100% clear on that either. I know it's supposed to allow more customization of printer drivers, and adds some other system extensions to TOS, but other than that, your guess is as good as mine... ;^)

>unsure.

Well, I tried playing an mp3 using an mp2 player on the Falcon, and it didn't recognize the file. I also tried renaming the mp3 to an mp2 file which also didn't work (I didn't think it would but figured there was no harm in trying!)

I've asked here, but so far no one has been able to explain the difference between an mp2 and an mp3 file. If the Falcon can do multiple AIFF files (with Cubase Audio) and mp2 files, not to mention MOV and AVIs with ANIplayer, I'm sure it could do mp3s. Isn't it just a slightly different compression scheme than an mp2?

A side note: Does anyone know of a PC/windows program that will convert an mp3 to another format (ie. mp2, WAV, AIFF)? My roomate has a PC, and if he can convert them to a useable (Atari) format, that would work too.

Interesting...

I used to use Warp 9 with my STE, and later with my Falcon.

I switched to NVDI when I decided I wanted the SpeedoGDOS font capability.
And as far as I can tell, they both pretty much did the same thing (as far as
speeding up the display goes).

I see no real difference between the two programs in the speed department...

80. [NEW] Eureka 10.98 is out including OPEN/GL

Newsgroup: comp.sys.atari.st
Date: 1998-10-01 00:00:00 UTC
From: LE COAT Francois <lecoat@ief.u-psud.fr>
Message-ID: <361346EC.BF017E1D@ief.u-psud.fr>
Source record: 92783

Hello Everybody,

Thanks to brilliant ATARI developpers O. LANDEMARRE and D. BEREZIAT,
OPEN/GL clone (called MESA) is now ported like Gem Dynamic Library.
My program Eureka 2.12 is taking benefit of their work and can
export a True Color Image, whatever is the resolution of the computer.
If you know Eureka, you would know that it is a 3D modeller, and
that many shapes are available. You can test Eureka in a complete
unlimited version downloading it on various sites, including
mine at :
http://www.ief.u-psud.fr/~lecoat
Let me know your opinion,
Thanks,
Bye for now ...

81. Coming SOON for UK Atari Owners

Newsgroup: comp.sys.atari.st
Date: 1998-10-01 00:00:00 UTC
From: Steve <AtariST@usa.net>
Message-ID: <907233536.9014.0.nnrp-10.c1ed1184@news.demon.co.uk>
Source record: 92784
Cross-posted to: alt.atari,comp.sys.atari.st,comp.sys.atari.st.tech,alt.atari-jaguar,alt.atari-jaguar.discussion,demon.ip.support.atari

If you are looking to buy or sell Atari software or hardware then this is for you.

Coming soon will be an auction site/area dedicated to Atari gear. So if you want to bag a bargain or you want to sell some Atari related stuff and you don't know what it's worth, the an auction is ideal.

The auction will be aimed at the UK market, but I think selling to countries within Europe shouldn't be that expensive.

The auction will be run by one of the UK's largest auction sites and will hopefully allow people to sell and buy all sorts of Atari wares; 8-bit Atari's, Jaguar's, 2600, 7800, ST's Portfolio's ANYTHING Atari.

I would be grateful for all the support I can get for this venture,. If you would interested in using this auction service please let me know via email at AtariST@usa.net. Without you, the user's support this service WON'T get off the ground.

Thanks
--
Cheers! for now

If they are SCSI, your floptical drives should be treated just like any
other removable SCSI drive. I'd recommend Uwe Seimet's HDDriver from you
nearest dealer, but other drivers might work.

Cheers,
Nick

>Case: Mega STE style desktopper case
>68030/32MHz complete 32 bit data path
>ST-Ram and TT-Ram memory (I can't remember details)

TT-RAM is only accessible for the CPU, can be set to burst mode. SIMM daughterboards with sockets for up to 256 MB were available at times.

>ST and TT specific screen resolutions

The TT screen resolutions weren't too impressive, except for the 1280*960 b/w ECL monitor mode. But the TT has a VME slot like the MegaSTE, and graphic boards of semi-professional/professional quality were available (Matrix TC1208, TKR Crazy Dots, to name two that were popular in Germany).

85. Strange MagiC 5 Problem?

Newsgroup: comp.sys.atari.st
Date: 1998-10-01 00:00:00 UTC
From: ecncomr@socal.com
Message-ID: <6uvhop$du8@enews4.newsguy.com>
Source record: 92788

I just had something rather bizarre happen with MagiC 5 and my boot (C:\) partition...

I don't recall doing anything unusual, but after a re-boot, everything seemed to be loading in the normal way, but right _before_ MagiC finished loading MAGXDESK, the file selector popped up, in the C:\GEMSYS\GEMDESK directory, asking which program I wanted to run (?!). And if I hit CANCEL, the file selector would just continue to prompt me for a file to run. If I hit OK, the same thing would happen. If I selected a program, then hit OK, depending on the program, I would either get an error message (ie. program exception error - which is equivalent to 2 bombs in TOS), or the file selector would just come up again.

Despite turning everything off for several minutes and cold-booting, the same thing kept happening. So, I re-copied my C:\ partition from a (very) recent backup, and re-booted - however, the same thing happened again!!!
At this point, I was starting to worry a bit, to say the least!!!

So, I wiped my C:\ partition (an activity that doesn't exactly make one feel comfortable!), and re-copied it from an older backup. And when I re-booted, everything worked ok...

<wheeeeeeeeeew!>

What the $%@^# is going on here?!?!?!

No programs crashed prior to this strange behavior, and there were no problems with the hard drive partition. There were no new AUTO programs or ACC installed either. I changed NOTHING before this happened.

I'm running MagiC 5.11 on a 14meg "standard" Falcon030.

Hi,

I'd like to add my name to the list of those who are confused about WDialog.

I've seen posts here which indicate that you still need WDialog even if you
have Magic installed. Is this true? I thought WDialog simply provided
MagiC-compatible AES-extensions to those OSes that did not have them.

Hi there,

After reading the Faq on the hard drive topic, it's still not clear (sorry)
: I currently have an 1040 STE with an ICD Link2 interface (DMA->SCSI)
connect to my hard drive. I would like to migrate to a MegaSte, the question
is regarding the ACSI interface : could I directly connect my ICD link onto
this plug ??.

Thanks for your help.

> this plug ??.

The ACSI/DMA interface on the MegaSTe is the same as the one on your 1040STe. You can simply unplug your Link2 and hard drive from the 1040 and plug it into the MegaSTe. You'll obviously want to load the MegaSTe desktop information onto your hard drive to replace the 1040 desktop, however.

Enjoy.

Sheldon

91. The Next *5* Callers...

I recently acquired a new Ram board for my Falcon from Systems For Tomorrow (great dealer, BTW!). Its one of those types that take single 72-pin SIMMs. (just what I've been needing for my Nemesis equipped Falcon).

Anyways, so I've now got a Ram-Gizmo board from Chro-Magic, that has 4, 4 meg, 30 pin SIMMs (rated at 60ns) just lying around, that I don't need...(brand new condition, complete with manual, and only a few months of actual useage)

So here is the deal: call The DarkForce! BBS at least once this month (October), and on Halloween, one lucky winner will win this Ram board for the price of a single phone call! Good luck to all our entrants! ;-)

I talked to a senior tech. about your lan with the falcon via Mac and he
says it won't work at all. Your equipment is obsolete and was built when
LAN didn't exist.

>explanation?

I think you're referring to me, Alan. I never mentioned anything about a last character timeout. The pauses I experienced would sometimes occur before the current article had even finished downloading -- that's why I called them 'interruptions'. What you're experiencing is something entirely different. To actually duplicate my problem, the news server would have to have an article (or articles) arrive just at _that_ moment, and even then the corruption may not occur because it was a random thing (but specific to these so-called interruptions).

Details aren't that important anyway, because from what I've read here NEWSie does different things to different people. The only common thread is that file corruption does occur, albeit with a minority of users (most of whom seem to use a TT).

Ted,

You don't do this using HSModem. This would normally be done from your terminal program. In the case of STinG/STiK you would usually set this using the Modem CPX - Peter has an excellent one as part of his STinG package.

Don't know about Keytabls.sys, but the directory \MAGIC\XTENSION\
is where you put DEV_FPRN.DEV, at least for MagiC from v 4, which
speeds up printing. I think there are other thingies that would
go there too.

Charles.

As a simple user, I have been shocked at these revelations about supposedly honest dealers. These are criminal offences. My thoughts:

Is there not still a `Federation Against Software Theft', at least in the UK? This has or had links with the police, who have Interpol for communicating internationally to other police forces. If the case comes to the worst, this may be the only recourse for individual software authors to stop the piracy /theft /breach of copyright /non-payment of fees. I don't suppose they really want to go that way, but the dealers should bear it in mind -- and pay up.

Cheers, Charles.

Source record: 92607

Well, version .92 of NEWSie just gave me the lost cluster problem.
And guess which file it was? The LOG file. I have all logging turned off in NEWSie, but as you know, it still creates a LOG file. Anyway, I've made it a habit of deleting this file on a regular basis, as it seems to help prevent lost clusters. But, today when I tried to delete the file, it wouldn't delete. So, I ran Diamond Edge, and sure enough, there was a lost cluster on my NEWSie partition, and when I looked at the lost data file Diamond Edge generates, it was indeed the NEWSie LOG.

So, I too would like to second Louis Holleman's suggestion that ALL LOGGING can be shut off completely in NEWSie to (hopefully) avoid these lost cluster problems.

I'll take a look at that, thanks.

Yeah, that's what I figured (that the benefit is a smaller size), but audio-quality-wise, they're the same.

>> Well, I'm not really a programmer (except for some stuff on the old Atari 8-
>> bits), so I'm not the one to do it!

Well, I was able to do quite a bit using BASIC (and some machine language routines) on my old Atari 800XL / 130XE. I made a few graphic demos, games, and little utilities. I was getting pretty good at the 8-bit's "player/missile graphics" too (animated sprites). I still have all that stuff put away in my parent's garage as well...

I always wanted to get into more programming with my STE, and now Falcon, but wasn't sure where to start. What would you recommend, GFA?

>You can't compare a 16MHz 68030 with new 400MHz PII, or slower

>
>I might sound a little negative here, but I do love my Falcon, and
>it's the only computer I have so far, and I use it every day.

Well, I've never owned a PC or MAC. I had Atari 8-bits in the early '80s, an STE, and now a Falcon. I'm still very happy with it too. Sometimes I just feel a little bitterness and sort of left behind when I see what else is out there.

The interest in mp3's is mainly due to the fact that I seem to see a lot of them out there now, and I would really like to be able to listen to them without having to give them to my PC-owning roomate first! :^)

And I see more and more websites using JAVAscript and offering some cool Real Audio stuff - all of which I can't do anything with.

It's just a little frustrating at times, you know?

What do you recommend I start off with, something like GFA?

My programming experience is limited to using BASIC (and some little machine language routines) on an Atari 800XL, 130XE, and Apple II back in the early/Mid '80s. I was getting pretty good with the Atari back then but haven't done any programming on the STE or Falcon. I would like to try though.

I did, but unless I'm missing something, it offers nothing more than
what John Eidsvoog's oldie but goodie Applier does. And Applier
doesn't have to be in memory, and multitasking makes no difference.

I'm not knocking you or your program. I'm just wondering if maybe
I'm missing something.

For those that want to check out Applier, it can be found at my web
site (URL below).

108. Converting an ST mouse into AMIGA!!!

Newsgroup: comp.sys.atari.st
Date: 1998-10-02 00:00:00 UTC
From: Paul-David <Pauldb@galileo.cris.com>
Message-ID: <6v3vsi$4tr@journal.concentric.net>
Source record: 92611

Here's how to convert / change an atari ST mouse to work on an Amiga.

First there are at least three different atari ST mice, made
by atari. They all look basically the same. How do you tell
the difference? Well look at the serial #.

If your mouse's serial # starts with an 'X' then the wires are
soldered and converting it will be difficult.

If your mouse's serial # starts with an 'A' then the wires are
socketed but in a different way than the mouse with a 'P'.

The instructions here are for converting a mouse with a
'P' as the first letter in the serial #.
Swap the yellow wire and the brown wire and you will have
yourself a mouse that will work on the amiga.

Inside the ST mouse there are only eight wires:
1 - Black - Right Button
2 - Blue - Left Button
3 - Orange
4 - Yellow
5 - White
6 - Red
7 - Brown
8 - Gray

Here's what the Amiga configuration should look like:
1 - Black - Right Button
2 - Blue - Left Button
3 - Orange
4 - Brown
5 - White
6 - Red
7 - Yellow
8 - Gray

I just wanted to tell everyone thanks for the information, my hard drive lives!

By booting with a blank disk in A:, the hard drive powered on , and holding down Control-Alternate-Shift, the hard drive was bypassed completely, allowing me to load the SUPBOOT driver manually (it worked even though my Host Adapter is an ICD) and install a hard drive icon.

Thanks again to everyone who responded. It's been a while since I've dinked around on the Ataris, so it's really comforting to know that there's so many knowledgable folks still out there and willing to help.

Well, I fired up the old Falcon today and wished I had not done so! The st157n started spining up and so did the syquest 44 meger, and that's when it happened!

The 44meger made a noise like I've never heard before, so I killed the power and ejected the 44 cart, the drive heads were bouncing around lose inside the cart!!! in ortherwords, it died big time! Now I'm going to have to save up for something else to go in, or maybe fall back to the old st-225n I've not used for 3 years! looks like the old falcon will have a nice long rest.

: Rgds, Derryck

Thank you, but...

Did that, download was fine, re-did the CFG file for TT-High, outputs
to screen, selects printers, but will not select any paper size but
11x17, and I do not have a printer that uses that.

What have I missed? And, where are the files for paper sizes, and
what are their names, if you know?

At least the download was apparently fine. Any suggestions, anybody?

there's a .TTP compiler included in the ST GUIDE package that's
designed to compile the ASCII file into a .HYP file; you can utilize it
also to decompress the .HYP into ASCII. Check the manual for the proper
command to pass to the compiler.

Are you saying that the STE version does not work, or there is no STE version? Guillaume has both 68020 and 68000 demo versions on his web page. I don't have an STE close by to check this out.

This drive works, I know several Atari users with this drive. I guess
that either the SCSI bus is not properly terminated or some jumpers are
wrong (less likely). Note that if you use AHDI as your hard disk driver
you will have to use another driver for this drive. AHDI doesn't support
SCSI drives with a capacity of more than 1 GByte.
You might want to check if HDDRIVER 7.6 recognizes your drive:

> They are slow and have an espescially bad designed plastic box : the
> same STF and STE did :(... I hate to connect and disconnect
> mouse/joysticks plugs from these very bad designed boxes !!!!!!!!!!

Yes, the joystick port design was pretty bad on those machines. But what
do you use a joystick for on a TT ? ;-)

The one-piece design is pretty neat IMO. I love the ability to carry the
whole thing around in one piece without the keyboard dragging around.
That's the main reason I got myself an internal 2.5" drive for my STE
too: ease of carrying it around.

If I had your woodworking abilities I probably would have built a
flight-case with integrated monitor, like the original Macs.

Sure, the Falcon is slower, but wait until I get my CT2 board!

Cheers,
Nick

> to access the Internet mostly to email. How can she do that.

This is answered in the Quick FAQ, with complete instructions. You need
to get the latest versions of the various packages. 4Mb is enough. If
she has a hard drive it would be better, but you can do it without one.
A mono monitor is also recommended.

> Is this possible through HETNET of PTT telecom. We live in Netherlands.

If this is a "normal" ISP that uses standard TCP/IP protocols, then
there shouldn't be any problem. Things with proprietary interfaces are
more difficult to get running, like AOL or Infonie here in France.

Cheers,
Nick

125. Newsie - A Caution and a Question

Newsgroup: comp.sys.atari.st
Date: 1998-10-02 00:00:00 UTC
From: rcain@zetnet.co.uk
Message-ID: <6v220l$8ep$1@roch.zetnet.co.uk>
Source record: 92658

First, the caution:

In off-line mode Newsie will not detect failed file-writes caused by 'disc-full'. This results in <no subject> entries in the mail and news overviews and the creation of a number of directory entries pointing to zero-length files.

Further, the .GRP file will have its message pointers updated assuming that these messages have been received OK and, if the switch is set, mails will be deleted from the server even though not actually received.

I have pointed this out to John R. and asked whether he can give an alert on write-fails and avoid skipping/deleting mails/messages not received. I am not sure when he will be able to schedule this.

In the meantime, all you European off-liners, make sure your partition has enough room before doing a download.

Next, the question:

Recovery from the unreceived news is fairly straightforward - you just adjust (manually) the pointers in the .GRP file so you re-request the missed messages at the next download.

Recovery from unreceived mails is more difficult. Most of us, being civilised gents, will have the switch set to delete mail from the server after receipt. Aggghhhh!

Is there any way of re-instating these deleted mails on the server? Do they actually get physically deleted or are they still there waiting to be binned at the next garbage-clearance? I fear the former :-(

If you realy need mp3, java, realadio etc now
do go for a PC or MAC.
I have myself Hades, PC, SUN but i use the Hades mostly
and i am not missing the mp3 or java but it wold be nice.
I think it is possible to do the decoding of mp3 on falcon but
it is hard for only one person to develope this.

Ok, that might not check it. The latest version (0.95) can be found on
http://noring.org/mp2/ and it's a GEM program now. Some people like
that better, some like the old tos version better. It's virtually the
same player.

> >Bottom line, after all this technical mumbo jumbo, is that it's much

The benefit is that you get the same quality (CD quality) with a
bitrate of 192kbit/s in MP2 and 128kbit/s in MP3. This means an mp3
song with the same quality as the same mp2 song, is 1.5 times
smaller. Quite a lot on long songs. AIFF's are of course even larger.

> Well, I'm not really a programmer (except for some stuff on the old Atari 8-

> bought it though), but the grass looks greener on the other side every day...

You can't compare a 16MHz 68030 with new 400MHz PII, or slower
Pentiums for that matter. The DSP is comparable in speed with a slow

Pentium, perhaps 75MHz Pentium, but it's limited in what you can use it for. It doesn't have very much memory to use, and it's only as fast as the 75MHz Pentiums in very specfic programs, e.g. fourier analysis, cosinus tranformations and other signal processes, since that's what it's built to be fast on.

You can't put a Java VM in the DSP, and the 030 is far too slow to make it useful. Newer Atari clones, Hades, Medusa, Milan, have faster CPUs, 040 or 060, and they might very well be fast enough to play mp3s in the CPU, and do Java.

About Real Audio, since I was able to play it almost in real time on my Falcon in Linux, I would certainly think that a TT, or an accelerated Falcon can play it. The sources that were released is only for 14.4 RA though, and most sites use 28.8 these days, because it's better quality. I don't know what the difference is between the algorithms though.

I might sound a little negative here, but I do love my Falcon, and it's the only computer I have so far, and I use it every day.

>I remember there was a discussion about ethernet on Atari`s.
>What was the conclussion?

If there was any, then it is : it's hard to find an affordable
Ethernet solution for Atari's !

>Is it possible to connect a Falcon via the Lan port to a Mac via
>the ethernet port on the Mac?

Yep. But when you smell smoke, it's time to call the Fire Department.
No, there is no direct connection possible since the so-called LAN
port on the Falcon is an RS-422 _serial_ port, which is quite a
different concept compared to Ethernet. Besides, bitrates hardly
match.

>
>If so, - can I surf on the intenet using IE or NS on the Mac, via the
>Ethernet and the internet connection on the Falcon?

Suppose you can interconnect your Mac with the Falcon using Ethernet.
Then suppose you use dialup on the Falcon (with a modem, yes?). Then
you have internet access on your Falcon. But then, you have to be
able to get this internet traffic to your Mac - through the Falcon-.

This would require IP masquerading. Not a trivial task on the Falcon,
I guess. (Atari/Linux folks : is there ipfwadm for Atari Linux ?
- and the kernel modules too, of course).

Don't cry, yet. You can find comfort in the fact that what you want
isn't trivial on Wintel boxes either. ;-)

MF>St Guide document to a plain Ascii

You can use the hcp.tpp from ST-Guide with the option -v for a ascii or -r
for STG file.

Example: hcp -v -oOUTPUT.TXT TEST.HYP
hcp -r -oOUTPUT.STG TEST.HYP

Gerhard.

Hi,

Thanks for all these answers. So, now I can plug an ICD Link2 directly to the ACSI port of the MegaSTE (by the way, why ACSI on the MegaSte and DMA on the 1040Ste ?). Somebody told me, that I should be able to connect internally to the MegaSte an SCSI hard drive : do I need a specific interface card or shall I plug the hard disk (that I used today on the 1040Ste) into the MegaSte ??. And is there any potential problem (version compatibily) regarding the Desktop (unplug from the 1040Ste and plug it onto the Mega) ?.

Quick FAQ, buddy, it's all in the Quick FAQ.

Format the PC disk as a 720K DD disk under DOS. Copy the files on the
disk. Stick the disk in the ST.

Getting on the net is also described in the FAQ. The URL is below.

Cheers,
Nick

If it were a single 30-pin SIMM socket, that would limit the data path to
a mere 8 bits. Although 72-pin SIMMs less common at that time, it seems
more likely that if it were a single SIMM socket, that it would be 72-
pin, or perhaps even a 64-pin SIMM (used in a few machines, such as one
of the Mac II models; IIfx, I believe).

<joska@nuts.edu> stated:

> The Falcon's 030 is a custom-made piece for Atari with only 16-bit
> bus. A real 030 has 32-bit bus and dynamic bus-sizing.

Why would Atari have gone to the expense of getting a custom CPU done
when a real 030 has the capability to work with a 16-bit bus (the dynamic
bus sizing you pointed out yourself)?

The Falcon's 68030 is a standard surface-mount 68030.

stated:

> Then why use a 68030 in the first place? What's the difference between the
> Falcon 68030 and the Amiga 1200's 68EC030?

The Amiga 1200 uses a 68EC020, not a 68EC030. That said, the only
significant difference I see is the MMU in the 68030, which I assume
Atari wanted for some reason (MultiTOS, perhaps?). If not for that, they
could have saved some bucks, by going with the smaller, cheaper 68EC020,
and Atari was usually quick to save a buck.

The message you replied to was the first I have ever seen that has
claimed the Falcon's CPU was a "custom" unit. Given that a standard 68030
can work with a 16-bit bus without problem, there would be no reason for
Atari to have gone to this extra expense.

> standard CPU, with a reduced bus size (16 bits instead of 32) similar to
> Intels 386 SX (32 internally, 16 externally)

NONE of the Motorala EC processors have a cut down data bus. The 68EC020
has a cut down *address* bus (24-bit instead of 32-bit). The 68EC030
lacks the internal MMU. I am uncertain of the exact specs of the 68EC040,
but as the 68040 lacks dynamic bus sizing, a cut down data bus would make
the chip more expensive, not more economical. There is also an LC version
of the '040, which lacks the internal FPU. I am uncertain if there is are
EC and LC versions of the '060.

<gerryvdb@tnet.com.au> stated:

> And I bet both machines boot faster then Win95, yes?

Yes, although the Amiga does not boot as fast as I would like. Then
again, it is working with and old 2.5" 170MB Seagate drive via the
Amiga's relatively slow IDE interface, vs. the 850meg 3.5" Seagate
running in PIO mode 4, used as the boot drive on my PC. If I switched my
PC to boot from the newer 5.1gig Quantum EL that holds my programs and
data, it would make for a close race. Investing in a Power Flyer EIDE
interface for my Amiga and a new, larger EIDE drive would no doubt tip
the scales heavily back in the Amiga's favor.

With the Falcon, and the OS all in ROM, so only a few accessories and
auto folder programs have to run, and I am at the desktop.

Actually the interface is called ACSI (Atari something), some people
call it a DMA port, but it's the same thing on both machines.

> Somebody told me, that I should be able to connect

That was me ;-)

> internally to the MegaSte an SCSI hard drive : do I need a specific
> interface card or shall I plug the hard disk (that I used today on the

> the Mega) ?.
>

Some MegaSTEs were shipped with an internal SCSI interface board. Look
inside and see if it's there. It usually came only with machines that
had a HD. If it's there, it should be plug and play.

The MegaSTE runs TOS 2.05 or 2.06, there uses the new desktop. On these
versions, the DESKTOP.INF file is replaced by the NEWDESK.INF file.
There's a link to a file that describes all the differences and other
stuff in the Quick FAQ.

TOS 2.0x will ignore your previous DESKTOP.INF file, so you'll have to
rebuild it from scratch, including reinstalling the C drive icon.

Cheers,
Nick

Nice. :-)

Just to bad that the upgrade of Lattice costs almost as much as buying it
without an upgrade. :-\

Was DevpacDSP realy useable? :-)

My thoughts exactly. I've emailed orders@hisoft.co.uk for more info on the upgrade, i.e. what the differences are between 5.52 and 5.6, but I have not had a reply yet. The only reason I can think of for the cost is that you get a whole new set of manuals. Anyone else have any knowledge on the upgrade?

Michael

If you connect with Sting (as most do?) masquerading is allready
built in. I have 2 ST's and a Win-95 pc connected with one of the
ST's as router. Works OK apart from the SCC gets overloaded with too
high speeds.

>
> Don't cry, yet. You can find comfort in the fact that what you want

What is hard in Windows is often easy to do on the Atari.

151. Can you boot from a Zip drive?

Newsgroup: comp.sys.atari.st
Date: 1998-10-02 00:00:00 UTC
From: danver@halcyon.com
Message-ID: <6v32ip$pj3$1@nnrp1.dejanews.com>
Source record: 92684

I am considering a link2 from ICD and am wondering if its worth the price.
One of the biggies is if you can boot from the zip just like a standard atari
HD. (ICD was not able to answer definitely) Does anyone know if this is
possible, or if you have to boot from floppy first, loading a driver first.
Also, how do you like the performance/reliability of the link2?
thanks
Dan Vernon

You should receive a reply within 1-2 working days.

> i.e. what the differences are between 5.52 and 5.6, but I have not
> had a reply yet.

OK. As so many ppl have asked for this -

Works on all Atari machines ST/STe/TT/Falcon!

* The Compiler*
Lattice C gives you tremendous flexibility through more than 100 compiler
options, including:
o Choose large/small/mixed code and data models.
o Backward compatibility modes for pre-ANSI, pre-processor etc.
o Full code generator optimisation control.
o Full prototype extraction facility.
o Unix style compiler driver.

* The linker*
Lattice C comes w/ a fast, high-performance linker w/ many powerful features
such as:
o Pre-linking.
o Automatic link vectors(ALVs).
o Full DR and HiSOFT symbols can be included in the executables.
o Fast, compact library format including a librarian.
o Support for global constructors/de-constructors.

* The Editor*
The complete, multi-window, GEM-based screen editor fully integrates the rest of
the system.
You can also customise the tools menu to run your own programs.

Project manager
Integrated within the editor environment is a powerful project manager which
allows efficient building of all types of program, libraries or pre-linked

object files.

Debugger
The Mon low-level debugger is supplied, complete w/ extensions for supporting source level debugging.

The Resource editor
The resource editor supplied, WERCS, is a full featured editor for designing menus and forms and includes an integral icon editor, in addition to full support for the 3D effects available w/ MultiTOS and Falcon030 TOS.

HTH ;-)

> The only reason I can think of for the cost is that you get
> a whole new set of manuals.

Yep - 3 manuals.

Yes, I can see that- I just wondered why there were two index entries
for one file in the first place.
>
BTW, someone suggested (sorry I've lost the attribution) that the
occasional 'hang-up' until last character timeout occurred if an article
was added to the newsgroup at the same time as Newsie was reading
another one. I have inadvertently re-read a couple of newsgroups, and
the identical articles hung-up, which would seem to rule out that
explanation?

I can't believe that there is an error message "Don't work with MagiC PC
TOS" from Calamus 1.09N. Did you start it under MagiC PC (with MagiC)
oder MagiC PC and a TOS image file? If you'd like to use it under MagiC:
monochrome, single tasking and close all windows before starting.

I solved the problem of separating email reading from email deleting by using Popwatch, which seems to integrate well with Newsie. Its killfile facilities are adequate, and it means that I can pass over emails adressed to my wife for her to download on her PC. Unfortunately, she hasn't worked out how to stop her PC downloading my emails and deleting them.

I may have missed some of this, but if you are having problems printing from GhostScript 5.10 and are using a TT or Falcon, check the "GS Console" window. If you are getting "media protected" as an error when trying to send a file to your printer, you most likely are using OutSide. Reboot your machine with OutSide disabled and the printing function should work - at least it does with my TT.

I have had problems in the past with programs not knowing the difference between actual TT memory and VM. My guess is that GhostScript is trying to write a tempory file to the HD partition the OutSide is using for VM, which is write protected.

Hi Dan!

Yes, you can boot from a Zip Drive when used standalone. However you
have to have an adapter (its an Atari problem - I got mine from
HiSoft) to provide line-power from the ST's joystick port. Its best to
buy from an Atari Dealer such as HiSoft or System Solutions.

The Link2 works fine, probably better than the other adapters such as
the Translator - CDRoms work better with the Link2. Having said that,
the Link2 has been superseded by the Link97, which is better (though
not having one I couldn't tell you why - I use a Falcon now which
doesn't need an adapter).

Cheers!

My setup works fine, however when I tried to dial my ISP's K56 line I got the same 2 bombs on trying to open a URL. (I'm using a 14M Falcon).

Don't know which version of CAB.OVL I've got, but it's 33764 bytes. Other versions I've tried don't work with my setup, including the 030 version for Falcons!. I've also got one specific for PPP connections - maybe I should try this one for the K56 line.

Anyway, see if you can get hold of the 33764 bytes version (or I can mail it to you) - I'm sure CAB.OVL is part of the problem.

Not entirely correct, TT-RAM is accessible by the TT DMA-controller as
well, which means that the TT-SCSI (but not the old ACSI) can do
DMA-transfers from/to TT-RAM.

Shouldn't it work on Magic, too? Doesn't Magic run GEM programs and
STing? Unless you're talking about ASH's I-Connect (or whatever it's
called). Then you'd have to make a whole different program.

>printer device in Thing! please anyone?

Hi Derryck,

Okay, I found a solution for Thing and MagiC which appears to work
until something better comes along.

Install MagiC's PRINT.TTP to print whatever, ATM I have it printing all.

In Thing's Applications/General/Parameter dialog enter:

$1 <path and file name of file with FORMFEED character>

In my case, I created the file ff.txt with the FORMFEED and placed that
file in MagiC's GEMDESK directory. So, my Parameters look like this

$1 c:\gemsys\gemdesk\ff.txt

Hope this is clear. Anyone have a better solution?

I just decided that a better solution is to take advantage of Thing's
parameter $1- which will pass multiple files, not just one. So, the
above string becomes

$1- c:\gemsys\gemdesk\ff.txt

I think so :-)
StringServer allow you to click on a string and pass this string to the
server to launch an application. The application have to support this
protocol. Could be interesting to have this feature in Okami.

I guess the difference between it and Applier is that Applier only
works by acting as an installed application, whereas StringServer can
take strings from within programs. But as you said, it doesn't do
you any good if the application doesn't support it.

Hi

I don't know if this helps! I am able to boot using an EZ drive, which is a
removable media hard drive!

Steve,

> Works on all Atari machines ST/STe/TT/Falcon!
>

As I remember, 5.60 had loads of Falcon and TOS4/MuliTOS improvements, enhancements and fixes. In particular, the Editor and Debugger went under the knife to sort out issues with the Falcon/TOS4/MuliTOS. The compiler also had a number of bugs ironed out. It was a good update that brought Lattice up-to-date for developers wanting to build apps for latest Atari machines/TOS.

Yes you can boot from a Zip, it's just a case of setting the options on the
driver as I remember.

OK, people, if you say so, then it must be true. I'm totally
unaware of Sting's capabilities, but this seems very interesting.
Are there any docs describing this feature of Sting in somewhat
detail ?

BTW, how's the ST itself - not its serial port - handling the load ?

Yes, that was it, Paul. I should have been using the full domain.

I'm up and going now with no real problems and will give Freeserve a
good sussing out before my next subs become due. I have mailed,
:ftp'ed and :http'ed, all OK.

The only negative point seems to be that Freeserve modems don't
understand VFC (Zetnet's do!) so I can only get a 14k4 DCE. I will
mail their support to see if there are any switches they can set to
give VFC-compatibility (then I'll probably get chucked off because I'm
not using a PC with IE!!).

If you know french... try having the Falcon surf the net and have the MAC
get the data from the FALCON!
The program is called Weblight. It's a web server for Sting. A really neat
program, but I can't read French so I'm having a problem getting it to run.
But the auther claims to have it working with a Mac dialing into the Atari.
The site also has masquerade module for Sting on the page.

It's only needed if it's the only device connected to the Link, as the Link/ST can't supply terminating power from the DMA bus (as I recollect). However, if you have a second device that does supply terminating power independently, stick this at the end of the chain, as the terminating device, and place the Zip in the middle of the chain.

Thanks Jo, I didn't keep a note of the URL, I was surfing at work! :-))

I actually had the oscillator on my shopping list for Maplin (UK chain of
electronics stores), but heard about Titan's Eclipse PCI card adaptor so will
probably go for that instead (yes, I know it's more money!)

No. Same with this HP660C, I have to give it an FF to get at the printout.

Any suggestions for a quick text printout utility to install for the printer
device in Thing! please anyone?

222. Newsie Problems - not me

Newsgroup: comp.sys.atari.st
Date: 1998-10-04 00:00:00 UTC
From: jimsmith@zetnet.co.uk
Message-ID: <6v7odrdij1@roch.zetnet.co.uk>
Source record: 92494

Hi Everyone,

I still consider myself a bit of a 'newbie' at this net business so please bear with me if what I have to offer is a load of bull - I can only say that it works for me.

I am using a 14 Mb Falcon fitted with Nemesis, running in single TOS.
My Internet software is quite limited and consists of:

STiNG 1.15 - to connect
CAB 1.5 - to 'surf' GFX-free for speed
CAB 2.7 Demo - to 'surf' when I want to see everything
CAB OVL - always the latest version as Dan puts it up
Newsie 0.92 - for mail and NGs

My CAB and Newsie programmes are kept in my COMMS folder on my Utilities partition.

Being a bit careful (?), I regularly check my partitions with Edge and soon noticed that Drive C always had at least one 'fragged' file. It did not take a genius to work out that this was probably the Log file created by the STiNG dialer, so I always made sure to put this file back to the drive as physically the last file when restoring after a back-up.

Reading of the 'problems' with Newsie, I decided to move my STiNG folder to a drive on its own in case my Drive C got corrupted. I have always used a separate partition for my Newsie folders (Download, Mail, Offline, Work) and another for my CAB cache folders anyway, and, not being short of HD space, this was no problem for me.

I have not had the corruption problems mentioned by some people before or after doing this.
I rarely read NGs on-line, though always read my mail as I get it from the server.
I always disconnect from server after downloading NGs.
I always quit Newsie then disconnect STiNG before reloading Newsie to read the NGs.

I have no complaints about STiNG or Newsie - other than, being ham-fisted, I occasionally delete NG items by mistake and cannot 'undo' it ! (I have mentioned this to John and he is looking at it.)

As I said earlier, this works for me. Perhaps a more 'basic' appoach may solve other people's problems ?

Hope this is of help.

ATB

Jim.

Hello everybody, I just want to say that my site is available (but only in
french for the moment). You can find some of my programs (with sources !) for
Falcon:
-PmDoom v0.05 (no DSP,ported from original sources from ID)
-Doom v0.75 (DSP version, original source from me)
-My demos (124 beers later and Xtasie)
-One Street Fighter 2 clone (old binary, no source)
-Sprite collision test with the blitter (source)

I will make my site in English soon (be happy) !

224. MPEG video players (was Re: Real Audio/Falcon YES)

Newsgroup: comp.sys.atari.st
Date: 1998-10-04 00:00:00 UTC
From: rich@rjelwell.demon.co.uk
Message-ID: <907507412_OASIS_NEWS@rjelwell.demon.co.uk>
Source record: 92496

In article <8O92CTM@tos.pl.net>
mb@tos.pl.net (Mario Becroft) wrote:-

>As for video, I have seen MPEG video players for the Falcon that manage
>something like 15 fps, from memory. If you went for a simpler format with
>less fancy compression, it should be able to handle it no problem at all.

All this talk in various threads about MPEG audio encoding and
decoding and the comment by Mario above has got me thinking about
MPEG video players on the Falcon.

I know of 4 different MPEG video players :
MPEGPLAY - a hack of a NeXT player to work on the Falcon, very slow,
CPU only, and locks up my Falcon040 on finishing
PLAYMPEG - Griff's DSP decoder, very fast, Key (I) frames only and
not MiNT/MultiTOS friendly
MPEGDSP - Much like PLAYMPEG
1stGuide - Plays all frames (I, P and B), slow, very system friendly

It would be great if someone could put together a DSP using, all frame
decoding MPEG player, audio would be great too.

Rich.

>
> 10, as there only were 2 or 8 meg add-on boards available.

Actually, 14 megs, which is the maximum amount of ST-Ram allowed
by TOS (on an STFM, you can get 15 Mb, because the TOS roms are
half the size, thus require less adressing space).

Obviously, this 14 meg limit is theorical on a TT, since nobody
ever produced the correct 12 meg board we would need for that, so
the real-life maxiumum is 10 megs.

226. Can anybody help?

Newsgroup: comp.sys.atari.st
Date: 1998-10-04 00:00:00 UTC
From: Colin Duncan <colin.duncan@easynet.co.uk>
Message-ID: <6v87u2$g0d$1@apple.news.easynet.net>
Source record: 92498

Our youth group has been given an old Atari 520ST with lots of games.
When the computer is switched on, a desktop screen appears but if the
computer is booted up with a games disk the screen shows wierd images.

The computer is connected to a monitor rather than a TV.

The game seems to be loading, the music plays ok, and the images
occasionally show text, all be it as if words or images are being distorted
and repeated across the screen.
Can anybody offer any suggestions on how we can get the games to show?
Thanks

Hmm...what model of ST did you say that was? I know of the 520, 1040, Mega ST, 1040 STe, Mega STe, TT030, Falcon, and STacey, but no 180. (there are permutations involving "F", "FM", covering floppy/TV modulators, as well as 2080, 4160, covering 2 and 4 meg models). Any of these models will have no problem with the Y2K thing, AFAIK.

PS Oh there was a Transputer and a 260ST at one time too... ;-)

240. Re: Newsie Problems - not me

Newsgroup: comp.sys.atari.st
Date: 1998-10-04 00:00:00 UTC
From: lockwood@calcna.ab.ca
Message-ID: <6v8i5m$ade@ds2.acs.ucalgary.ca>
Source record: 92512

I have not seen anyone mention the problem I am having with Newsie 0.92, but maybe this will ring a bell.

Every so often, at random intervals when reading newsgroups, I will click on a posting, and get a alert that reads " EOF received from a remote host". When the message appears shortly after, it is completely blank, and any attempts to read other messages results in more blank pages. Disconnecting from the host and attempting to reconnect results in Newsie hanging. If I quit Newsie and then restart it, it still hangs.

The only way I have found to clear this, is to do a complete cold re-boot, at which time Newsie works fine.

This is on a stock TT030, running Magic 5.11, Sting 1.15, and Newsie 0.92.

Any help would be appreciated, as this is really annoying.

Most games work in Low Res. I guess the monitor you mention is a Hi
Res mono. The wierd image is probably the game trying to tell you that
it doesn't work in this res. but it is being wrongly mapped on the
screen.

I've had this, but in previous versions of Newsie too, and not in the
situation you describe.

It seems to be if the line is inactive for too long - it disconnects
at the server end. For example, if I'm editing an e-mail (for more
than about 5 minutes) and then post it, I usually get EOF.

Sorry, haven't got an answer though!

Strange. I just tested with both swedish and english rsc. Both worked
OK. They share the same structure btw.

The program is written with Face Value without any special tricks.
Should be as compatible as Face Value itself.

Even tested in 800*600*16 on the pc (Tosbox) without problems. Could be
Magic? I use Geneva myself.

Does it lockup completely (and forever) if you close the connection.
There is a timeout (Server Preferences) that controls how long NEWSie
will wait before timing out a connection. Note that after NEWSie opens
the connection to the news server, it does not close it until you
click the 'Disconnect Host' menu, or end of program. NEWSie will try
to close this connection properly, and will timeout if STiK/STinG has
been disconnected first.

It is entirely possible that if you simply wait for the 20-30 seconds
for NEWSie to decide that STinG is not going to receive a connection
close from the news server, you will find everything to be OK.

>
Yes, turning off the LOG options does not stop the creation of a LOG
file, or writing to it. You should not have LOST Clusters on a normal
basis. When NEWSie quits, it closes the LOG file and everything
should be fine. When NEWSie bombs, or when your system locks up while
NEWSie is running, the LOG file is not correctly closed, and some LOG
records are not written to disk.

LOST CLUSTERS means: allocated, by not found in any FAT entry. This
can happen with buffered files, typically used in C programs, when
there is some problem closing the file.

If you attempt to copy the LOG file while NEWSie is running, there
could be some problems with software not being able to copy a
currently open file. (i.e. there is no 'end-of-file', the file is
still be created.)

Yes. InverseMedia in Germany has a generic driver for all Epson printers.
I believe that I paid 99 DM for that disk, and their service was excellent.

Try sending e-mail to Ulf Dunkel at ulf.dunkel@t-online.de. They also have
a shopping-list web page which will take your name and address and Visa card
number, and most of your money. There is a lot of good stuff on it.

I got a 600, refurbished, with full warranty, from Epson, for less than
the cost of fixing a Color II. Try www.epsonsupplies.com.

: and are "Ultra SCSI".

: Does anyone have any recommendations on which drive I should get?
: Also, if I have a large drive, what is the largest partition size
: I should use (256K)? Thanks for any help/suggestions. Mark.

Well, when my TT needed a new disk drive, I called Megahaus in Texas,
from their ad in Computer Shopper, and asked for the smallest drive they
had that was SCSI anything but Quantum Fireball, and have been pleased
with what I got, which is Ultra SCSI. They also have listed an adapter from
68 pins to 50 pins, for about $45 US, which supports the idea that SCSI
is backwards compatible.

From what has been posted here, some later Fireballs will also work.

I am using ICD Pro Utilities, and probably have ten 100 meg partitions
for a 1.2 gig drive. I also own HHDriver, which is faster, and use that on
an STe, and which I would also highly recommend. I just happen to like ICD
for putting different physical drives on separate lines on bootup. There
is no accounting for taste. That one also has ten equal divisions of a
1.2 gig drive which used to be home 2 on a unix system.

Thanks John, will try that.

In the meantime, here's another problem for you!

My FTP no longer gives me a directory listing when I connect to a server. Mainly, I need to connect to the Zetnet server to upload my web pages, but it also happens with all the other servers as defined in DEFAULT.SVR initially.

I don't know what's changed - I recently upgraded to v0.92, but I moved back to 0.90 when I noticed this was happening and it's the same.

I can upload pages OK (and they appear on the server when I request them from a browser) but Newsie just won't give me a directory listing after Send Request and I therefore cannot select files to delete them or move to a subdirectory.

Any ideas?

You'd be surprised but IP masquerading *is* a trivial task on the Falcon.
Many people do it using STinG. STinG comes with a masquerading module.
This works just fine.

However I believe there is no Ethernet solution for the stock Falcon with
a STinG driver.

There are ST-Guide format docs in the STinG package.

> BTW, how's the ST itself - not its serial port - handling the load ?

What do you mean by "how" ? It's doing very well with the available
port speeds. With Ethernet on an ST you start noticing the load of course.

266. GhostScript and Printing

Newsgroup: comp.sys.atari.st
Date: 1998-10-04 00:00:00 UTC
From: shammond@loop.com
Message-ID: <6v6fh3$m0t$1@supernews.com>
Source record: 92579

After looking at what GhostScript 5.10 is doing on my TT I figured out a way to get it to print without having to re-boot with OutSide disabled

In GhostScripts' CFG file change the path of "setenv TMPDIR=p:\" (default setting) to a partition on your hardrive that has 30 or so free megs. In my case this is "setenv TMPDIR=j:\". GhostScript wants to set its own 'scratch disc' and if it cannot find enought free space on a 'legal partition' it then tries to write a temporary file into VM, which OutSide will not let it do as that partition is write protected.

Save the CFG file and restart GhostScript. Printing should now work with OutSide active.

I have been able to print out PDF files (from Easmant Kodak's web site) in both color and B/W using an Epson Stylus Pro (360 dpi) under normal TOS 3.06 and MagiC 4.0.

The only problems I have run into is that the PDF files will only load one page at a time and you have to go activate the Consule window and then press return to get the next page to either load or print and that the level 3 postscript files from EK's web page will not load.

Steve Hammond

: >Did that, download was fine, re-did the CFG file for TT-High,

: All you have to do is to resize the console window once GS has loaded and
: then resave it - the new coordinates will be saved back to the config file.

The plot thickens. Downloaded the TT file again, and it was longer.

Accidently used the German RSC file, and Ghostscript seems to accept settings.
Changed to the English RSC file, and got the same problems I had before.

So, my copy of the English RSC file is munged, and so was the main program.

This sort of thing just cannot happen. Http and ftp always work perfectly.

I will pretend that I know German, and try some printing.

>What do you use?

I have to begin by admitting to be a platform traitor here (Atari-->PC). But for my day to day MIDI
I favor Cubase, an application that learned on my faithful Mega (and my 1040 before it). It is a
very powerful, intutive and easy to use application. Cubase is nice because it can grow with you as
you call upon it to do more and more complex tasks. Another plus, since it's still in production,
documentation is easy to find.
KCS is a different animal entirely and one of the many reasons that my Mega ST still takes a proud
seat next to my PC. KCS is a sequencer in its most splendid and primal form. It's architecture is
very different from the current generation of MIDI "sequencers".
To put things into perspective, Cubase etc. treat the entire song as one long _sequence_ and
limits you pretty much as to time signiture and measure lengths and so on globally.
KCS is an old school sequencer. It treats the song as a collection of sequences arranged in an
ordained order governed by a time track. It is much more flexible than Cubase.
For example, sequence one is defined by its length counted in "clicks" (my own loose term) and
subdivided into measures of an user determined length. You can set up very complex rhythm patterns
by adjusting these values. You can, for example, make seq 1 = X number of measures at 120 bpm with a
structure that allows a 4:5 rhythm (eg. The bass playing 5 "quarters" to the measure while the drums
play 4 quarters to a measure). Seq 2 is X number of measure in straight 4/4, while seq 3 is X number
of measures in 15/16.
KCS allows you to _sequence_ these "parts" (as current apps refer to them) into a coherent whole (a
song), but still allows you to edit them as separate entities that are song independent.
As an example, let's say (in the above exaple) that seq 1's transition wasn't smooth enough

and
too abrupt. How about adding a couple of eighths to the end of seq 1 (to set up the meter change?).
No problem and no need to mess with midi TM values....
KCS is the way to go if you are interested in arcane electronic composition or photo-realism of a
midi track (A very steep learning curve is involved). However, if you just want to lay down some
down and dirty techno or industrial (4/4), stick with Cubase. It supports the time signatures that
you need.

Developing/testing software that runs on an ST and uses a joystick.

For example, some years ago (1993, I think) a musician (and member of the local Atari user group) needed some way to dim his screen while he was out performing, so I wrote a quick screen dimmer that used the joystick to trigger the screen to dim - much easier for him than a desk accessory or hotkey activated util.

I only had a TT, he used a 1040STFM.

(I've got no idea where the source code for that dimmer is, BTW)

At one time I reported a number of bugs in the Lattice C editor (same bugs exist in the HiSoft BASIC editor as it happens).

I did get a reply, but it entirely failed to address the concerns which I had, instead I was sent a copy of some program called arrowfix (if I remember correctly) which had absolutely nothing to do with the bugs which I had reported.

I believe another local Lattice owner had a similar problem.

How can you sell products if you refuse to support the software, if not with updates containing new features, at least with bug fixes? After all, it's not the user's fault that the software contains bugs. I do not believe it is satisfactory to purchase the software only to find that it contains bugs, which will not be fixed!

: it requires data/sec, so you need to compress that. Which compression?
: I don't know. probably not mp3, so even your own format. This factor
: of compression needs to be quite big, and the algo must be fast. The
: prob is that the falcon at 16mhz is not fast enough for this
: supposedly algo.

I don't see why not. That is not a very fast data rate at all.

In fact, it is demonstrated by the following facts:

It's little while since I measured it, but from what I recall I found that my TT was able to decode a GSM audio file from a US Robotics modem faster than real time. That was just with some standard GSM source code compiled with gcc, no special optimisations. I do not believe there is any question about whether the Falcon could handle it if it was optimised somewhat, or maybe even as it is. Especially if the DSP could be used.

As for video, I have seen MPEG video players for the Falcon that manage something like 15 fps, from memory. If you went for a simpler format with less fancy compression, it should be able to handle it no problem at all.

So it would appear that the Falcon should be capable of decoding audio and video in real time, but of course I cannot say whether it would do that with any arbitrary video and audio format.

Yeah>>this has happened to me a few times..the way I got around it
is to do the above or ALT A, so that the A drive comes up. Load in
your backup disc of ADHI.prg and double click on that ..then at the
same time hit ALT C, and hopefully the contents of your C drive
comes up.Then go to the auto folder and get rid of the prgs that are
making the problem.
Another way to get around this whole thing and to make it safe to
"try" things out is to get "MouseBoot" or another type of autoboot
manager that lets you pick your auto and ACC programs at boot time.
I am sure they are available at most atari FTP sites.(under
utilities)

But it depends on what version of ST you have. You might have one that
requires an External drive...or the operating system might be on disc,
if it is a REAL early St.Other wise...you might have a booting
problem.

Steve has recently been asking the atari community(this newsgrp) for help on music sequencing . He was considering selling his ST for something "else".
BUT..had decided to get a TT030 to meet his musical needs, and it looks like he is extremly happy with it. I am very happy myself when someone see's the difference between working with a PC compared to a TT for Music applications. So..thats the story..one that should make this newsgrp Proud to make a difference!!

Message-ID: <6vaqfe$27t$3@plutonium.compulink.co.uk>
Source record: 92395

Hi all,

I've a few questions about using 1stGuide that I can't answer myself by fiddling:

How do I use the Text-Font setting in the config menu (choices are normal and VA-File)

Is it possible to print _text files_?

Having set 1stGuide to send output to GDOS and running it as an app rather than as an acc, how can I access the config menu again to return output to the screen?

And finally (for the moment!) what is the purpose of the index file?

I've registered the prog with InterActive and am waiting for the master disk with the complete archives - but I've a strong suspicion that any docs are going to be in German so I'd appreciate any head starts that might be available.

->* Tucson, Arizona | TI-99/4A Atari ST *
->.

I've got ICD Pro v6.5.5, and you can boot from alt partitions by holding
down the corresponding letter. You can also bypass everything but the hard
disk driver by holding down <control> when the ICD logo, and hard drive
info screen appears. (its actually <control>, then <space> or any key).
Holding down <alt> from boot-up gives you a screen with drive A: and drive
B:. If you have an auto-booting floppy in, then holding down <alt> right
after the system first accesses the floppy will cause the floppy to boot.

Hope this helps, if you needed any more.. ;-)

Hi Gordon,

just check the site, domain and organization lines in O.INF.

Furthermore, check the usersettings in Popwatch (thinking you're using
that one for the transfers).

I've got no trouble getting my real e-mail address in the "from" line.

Suggest you upgrade to 1.35, it's got some nice extra features!

Similar to my experience. However, when I hit CTL/ALT/ESC the
taskmanager of Magic comes up, and I have the option to unfreeze
(which usually doesn't work) or force-quit Newsie (which does).
Restarting Newsie without first re-booting and re-connecting still
gives me the frozen lockup when Newsie attempts to connect with my
News-server.

I always quit Newsie before quitting Sting/logging off.

Yes, I think that FireNews supports it. I've not tested FireNews yet, so
I can't tell. AtarIrc supports it and a program called Farmer. Farmer is a
TosWin "clone", which is used to run TOS programs in windows under MiNT.

I hope more programs will support this, since it's very easy to do. Read
the SUPPORT.TXT in the archive to find out how :)

Well, there are some nice uses for it other than the "String-serving"
feature. I've installed it as a viewer for all programs in Thing, so that
wen a file is opened in thing, it gets sent to the stringserver. This
allows me to sent the file to different applicationds depending on the
keyboard status (shift, control, alt). Like, when I click on a .s file, it
goes to a viewer (textview, for example). With shift held down, it goes to
QED, and with control held down, GenST.ttp does its work. Same with
picture files. If I want to view the picture, I just click on it. If I
want to process the picture, I hold shift down, and then some big heavy
image processor is loaded.

I hope that more programs will be supporting this, since supporting it is
very easy for programmers to do. :)

Hi,
Have a look at my homepage. There is a page dedicated to CAF compatible harddisks. It's about to have some additions, since I've recieved reports about some more drives recently. Of course, models of harddisks come and go, so I always ask people to send more information to me, so I can give the info away to everyone who needs it.

Best regards,
Claes

I use Ease also, but if Ease melts down on me (e.g. I try to use it
in too small of a screen size or it crashes), Magxdesk automatically
gets loaded.

Asking the author of the program is probably the most promising way
to solve problems, provided you were kind enough to register for
encouragement and support :-). A good many times I find people
complaining about this and that who never consider to compensate
for the authorï¿½s efforts, thus decreasing my encouragement for
further Atari support.

> I've registered the prog with InterActive and am waiting for the master disk
> with the complete archives - but I've a strong suspicion that any docs are
> going to be in German so I'd appreciate any head starts that might be

I hope Joe Connor will serve you. You can also download the master disk
contents (the version I provided last to Joe Connor) from my web site with
the following address:

http://www.esc.de/homes/guivol/1stguide/gui_dist.zip

(around 1 MB file size).

My intention always has been to keep any releases open to the public or
at least available to people who ask for something _without_ deliberate
restriction!

Your suspicion is true, though, that the initial docs of 1stGuide are
in German (but not for the newer tools!), because there was insufficient
encouragement to enhance the old docs or translate them to an international
version, sorry.

> How do I use the Text-Font setting in the config menu (choices are normal
> and VA-File)
>
> Is it possible to print _text files_?

Only via GDOS, because 1stGuide was conceived as a pure VDI-output program.

> Having set 1stGuide to send output to GDOS and running it as an app rather
> than as an acc, how can I access the config menu again to return output to
> the screen?

Holding down the right mouse key while selecting the ACC menuitem or starting
the APP will open the config menu.
Holding down Shift-Alternate will select the alternative output option.

> And finally (for the moment!) what is the purpose of the index file?

It is referenced when using the "Help-Protocol" to search for selected items.

This company is called Xircom and they specialize in hooking up different

types of protocol computers. I'm not sure if they have anything for
ataris. Another thing, you need a parallel port for your computer. I would
look for the impossible but always with a purpose. My counterpart fart it
off. He's more involve with ethernet and establishing website. is right
about not able to hook up your equipment to ethernet equipment because in
practical sense it is not practical. If your into experimenting and doing
the impossible then go for it!

If you have any questions let me know. I would like to know if this does
work.I would like to tell this to my lead tech.

Thanks

The trace for the control key breaks where it goes over a sharp edge. It is
not close to any other traces, so it is easy to fix. I cut a tiny length of
wire-wrap wire, bridged the gap with that, "glued" it in place with General
Cement Nickle Print, let it dry completely, rounded off that sharp edge,
and all was well after that. Or, you can get a new mylar from Best or B and C,
but either way, there are an astounding number of screws holding the
keyboard together.

>want to process the picture, I hold shift down, and then some big heavy
>image processor is loaded.

Well, Applier does this and it doesn't have to be in memory and
doesn't rely on any program supporting that feature.

For example, using Applier, if I double-click on a JPEG file in Ease,
it loads a MUPFEL script, which temporarily renames the file to
temp.jpg (since the Apex viewer can't handle long filenames), loads
apexjpg.ttp, and then renames the file back to its original filename.

If I hold down shift while double-clicking on a JPEG file, it loads
another MUPFEL script which loads JPEGTRAN, coverts the file to non-
progressive and then basically does the same thing as above.

If I hold down alt-shift, it loads David Bolt's lowercase utility and
converts the filename to all lowercase.

Etc.

The point being, Applier will handle any shift combination, allows
you to designate a program and command line based on that shift
combination, and does so without having to be in memory and works
with any program that handles command lines.

Again, not a knock on StringServer, but just pointing out that
Applier does much of what it does already, and in some ways does it
better (since it doesn't have to be in memory and doesn't depend on
multitasking).

I am very interested!!!

I have owned a used TT for a couple of years and like the machine very much except for the lack of a good video output. To have the option to buy a
video card would be a dream come true. It seems they video boards for the TT are no longer available.

FYI, Mario has helped me in the past. When I first got the TT, I managed to scramble the data on the hard drive somehow when adding addition hard drives to
the SCSI ports.

I thought all was for lost. Fortunately, Mario answered my call for help. Over the course of several weeks, he managed to fix the boot sector and
instructed me how to use the editor in Diamond Edge to reconstruct the drive so I
could read the data. Wow, I was impressed. I told all my friend how someone on the
other side of the world saved me from reformating my drive and destroying my important
files.

Mario, what a guy!

Thanks again and I look forward to future developements. Please feel free to email when the your board is available.

Body handling: Binary attachment payload not displayed: pacman.vcf

Hello,
well so far there have been *145* votes on the OS poll, MagiC is Still in the Lead :-)
Here are the results:
55 votes for magic -38%
20 votes for single tos-14%
29 votes for MiNT-20%
12 votes for MagiCMAC-8%
13 votes for Geneva-9%
8 votes for magiC PC-6%
7 votes for STonX, Winston etc-5%
1 vote for LINUX-1% :")
Have you voted? If not go to http://bengy.atari.org
or send me an email with your vote.

New: (downloadable from my web-page)
Start Me Up v8 is out, now supports gemscript, improved launching of programs, various bug fixes.

Winframe.rsc for MagiC 6- Modified rsc file by Noah Silva. If you use MagiC 6 download this and give it a look-it will change the appearance of the Windows!

Teli 1.01- Telnet application for I-Connect no longer in beta. lots of bug fixes.

Freedom 2.07/CA Dance (CD player CPXE for Freedom2) and english applications/setup available aswell.

String Server 1.0 You really are missing out if you use atarIRC and dont have this program installed and properly configured. In irc for example, when someone sends you a message with a URL in it, just click on the URL and you can make CAB load it, save it to a file, etc etc. The possiblities are endless.

Popular files:
Ger2eng.prg- remaps the keyboard if you are using a german version of MagiC.

ShowM-Brings back your mouse pointer when it disappears! (so very handy)

Thanks for your time,
Bengy

You can get a mouse Accelerator from UNICH called silkmouse, which
goes in the autofolder and can be configured with a CPX module.Works
very well on the TT.

See if you have XCONTROL. ACC on your C drive. This is the ACC for the
CPX modules. Go to the far right corner of the desktop menu, and see
if XCONTROL is present. If it is, Click on it, and see if you have a
control to turn off the sound.It is usually under GENERAL. There might
be a section called SOUND to adjust volume/left/right.

Email me if you have any more questions..I know what it's like to be
new at a new machine!

310. NEW GAMES for JAGUAR Petition

Newsgroup: comp.sys.atari.st
Date: 1998-10-05 00:00:00 UTC
From: mwcarter@my-dejanews.com
Message-ID: <6v9p5b$lt4$1@nnrp1.dejanews.com>
Source record: 92445

Hello. As you all probably know, there is a rekindled interest in the Jaguar due to games in development such as Battlesphere, PROTECTOR, Gorf 2000, *NEXT* and the Age of Darkness. Other games, such as SkyHammer, Soul Star, Hyper Force, etc. rest in a state of limbo as they are completed, but publishers, such as Telegames and ICD may not feel the effort is worth the risk involved.

Enter the NEW GAMES FOR JAGUAR Petition.

The first Jaguar Games Petition (thanks to Steve Scavone) was an intregal part in letting Telegames know that they was an interest in further Jag publishing, and as a result, we have Zero 5, Iron Soldier 2 (CD and Ltd. Cart. Edition), WORMS (Ltd.), Towers II, World Tour Racing and Breakout 2000. ICD also got into the act with Aircars.

The problem is, that was then. Now we need to let the prospective publishers know that the interest is still there, the user base is still there, the MONEY is still there. Want to let publishers and developers know this? "SIGN" the Petition.

Just go to:

http://home.sprynet.com/sprynet/mwcarter/petition.htm

Or if you don't want the hassle, just send an e-mail to:

jaguar_games@nextgenfan.com

Including the following information:

Subject: New Jaguar Games

Body:
YES!
Your Name
Location

Thanks for your time, and let's get this moving.

>What the $%@^# is going on here?!?!?!

MagiC can't load application id zero (ie the desktop application). It
is prompting you to select one (although other apps might run).

I use Ease. If something happens to corrupt one of its critical files
Ease will die leaving MagiC no choice but to bring up this file
selector. When this happens to me I simply point it at the original
MagxDesk program and use that temporarily while I locate the
corruption and fix it.

This is wrong.
POP3 protocol only mark the message as deleted. They are NOT GONE
anywhere. Only when quitting the POP session, the marked as deleted
messages will be flushed/totally_removed/kiss_byebye. Only when
finishing the pop session.

On what computer ? An ST surely not. The STE has an IDE board available
in the UK to which you might be able to connect a CD-ROM drive with an
adapter.

I made the program primarily because I needed to convert some 1.0N
documents myself.

The CTX convertion was quite straight forward to implement. Maybe
someone else (who knows the SL text format) could code an SL version.

Actually from the latest rumors gathered at the Neuss computer show, it seems that the news is much sadder than a simple piracy affair. Terre du Milieu seems to have gone bankrupt. This would be the explanation as to why they have not paid back Uwe Seimet. I'm not trying to find excuses for them, but it explains the problems they have had. It seems that in the past they have always had a very good record.

TdM was always very supportive, and was the last Atari dealer here in France. That means that now, there will be no more french distribution or support for the Milan, the Medusa or Calamus, Papyrus, Cubase, NVDI, N-AES and definitely HD Driver. They were also the ones who published the last Atari magazine in French. This means that there will be no more information for the off-line or non-English-speaking Atari community.

I hate to sound so pessimistic, but I'm afraid this will mean the
short-term demise of the french Atari market.

The only company left is Centek, and they are more hardware types. Maybe
they will have to pick up some of the support TdM used to provide if
they want to keep a market for their hardware.

Cheers,
Nick

> Hi,
>
> How do I connect a (s)VGA screen to a MEGA ST.

A VGA screen will only be able to display ST-High resolution, which is
640x400 in monochrome. Even then, you must check that ST scan rates are
inside the screen's tolerances. Check out the Quick FAQ for details.

It's better to get a real SM124/125/144 monochrome screen.

For colour, you need an RGB or a TV or a Multisync monitor that supports
the ST's scan rates.

You don't need any special options. If the ZIP drive is the first drive
with a bootable partition (with a hard disk driver properly installed)
on it, the Atari will boot automatically from it.

The LINK97 has the advantage that drives like the Quantum Fireball can
be used with it. This is because the LINK97 provides initiator
identifcation, i. e. it has its own SCSI ID. This is required for the
Quantum Fireball (and probably other devices) in order to be recognized
at all.

The TT supports partitions of up to 512 MByte. If MagiC or Big-DOS is
installed the maximum partition size is 1 GByte.

Either there is no drive connected, or you have a bad desktop.inf file
in which the lines have been removed.

Best is to boot with a blank floppy (format one if needed). then reboot
with it. Once you have the icons, you should save the desktop.

If you're booting from a hard drive, you will have to bypass it (by
pressing Alt or Control when the HD driver lines appear on the screen,
then proceed as above. You will need an AHDI floppy disk to regain
access to your HD.

The best one is PaCifiST, but whatever you do, no emulator will be 100%
compatible. Even Atari was unable to make the STE or the Falcon 100%
ST-Compatible. If you want that level of compatibility, get a real
machine. They are dirt cheap nowadays, so you have no excuse.

What kind of monitor. If it's a monochrome monitor, then the behaviour
you describe is normal. Most games require a colour monitor or a TV
whereas application software is much better on a monochrome screen.

Try connecting it to a TV for games.

Have a look at the Quick FAQ, as you sound pretty new to Ataris.

Cheers,
Nick

I think I already answered you by email if you are the same person who
posted to the FujiBBS message board.

Atari never built a 180ST. I think you are referring to some rebadged
machine from a third party vendor running some special software.

The machine itself will certainly go beyond the year 2000, since STs
don't have an internal battery clock anyway. The problem is any software
that might be running on it or any retrofitted battery clock. Maybe you
have more details about that machine.

Maybe you can try setting the machine to 31/12/99 at 11:59 pm and see
what happens to your software.

Cheers,
Nick

Hi Jonathan,

well, beware: either switch on your ST180 (?????????) at 23:45:00 on Dec 31, 1999 and have a look at what happens: Atari built a nice feature into TOS, so it will explode with loud bangs and lotsa fireworks at exactly 0000 on Jan 1st, 2000.

You can delay this action by NOT switching it on until "later".

Now, is this the "word" on the Windoze platform? Hardware NOT SURVIVING the millenium, or the millenium change?

Good Lawd Almighty.... what's the world coming to???

Don't worry, your ST (or whatever) will live happily into 2000 and on.

You may have problems with the clock, but AFAIK that only turns up years after the millenium change.

If the machine dies, it's probably from other reasons than the millenium change...

Happy computing!

>Any help would be appreciated, as this is really annoying.
>
Hi Frank,

this is new to me. Since I only use Newsie for online work now, mainly in binaries, I tell you what sometimes happens here:

D/L an article (with some attachment), next the box pops up if I want to extract it now or not, so I click "yes" and it starts unpacking. Sometimes there's an "EOF" message and the system freezes. Now just then I hit "CTL-ALT-ESC" (that's the taskmanager of MagiC, as you know) and the system (or Newsie) unfreezes again. I won't get the task managers screen, Newsie simply unfreezes and I can get on with the stuff. You could try for that option.

As John suggested in another posting, quitting Sting first before ending Newsie or what others suggested: quitting Newsie, then Sting, then re-starting Newsie is not very practical at all. I'm running several clients here on Sting, so what I do is "disconnect from host" with Newsie, then fetching news with Newswatch for Okami, next hook up CAB if I want to do so, etc. etc. etc. At the end of the session I just disconnect with Sting.

I still gather a better practical solution for Newsie would be an option "no logwriting"...

My dime, anyways.

>posting of Oct. 1st ?

Yes, it does, thanks, Peter.

I haven't a clue how PPP connection works but I guess the server must
have been overloaded and the failure was because it could not allocate
an IP in the time allowed. I tried the same script an hour or so later
and it all worked fine - and has done ever since :-)

The only problem with this ISP is that it appears not to support VFC
(which is how my Zoltrix modem implements 28k8 DCE).

With a program called q "mouse accelerator". You can find plenty of
these on the umich FTP archive. Have a look in the Utilities/Mouse
directory.

http://www.umich.edu/~archive/atari/
or
ftp://src.doc.ic.ac.uk/packages/atari/umich/

> How do I keep the machine from
> beeping everytime I press a key??? Cut the speaker wire?

That's an option in the control panel. Do you have CONTROL.ACC or
XCONTROL.ACC ? If not, get XCONTROL.ACC (that loads CPX control panel
extension files), also on umich, in the Utilities/Controlpanels
directory.

Cheers,
Nick

Erm... The Mega cannot run TOS 3.x, which is the version for the TT. You
must be running either 1.02, 1.04 or maybe 2.06 if you upgraded the
ROMs.

> Will CAB do a complete graphics interface with the I-Net yet using this hardware and os?

If you mean, will CAB allow you to browse the web in Gem, then Yes. If
you have a hard drive, then it will speed things up.

You also need STiNG, HSModem, and CAB.OVL. This is all explained in the
Quick FAQ.

Cheers,
Nick

No, this cannot be done.

The ST's ACSI/DMA interface can be adapted to SCSI, but certainly not to
IDE, which uses different signals altogether.

I didn't thought that type of computer is important. As stays in subject it is ST (yes, old good ST). IDE interface is self made, practically identical to project from German C'T magazine - September '93. Of course it required lot of soldering in machine, but works fine with many hard disks. Btw. material cost is under 10 DEM.
I tried with metados (BouB recommended), but it not recognises CD ROM drives - I checked with Philips CM207 (2X speed) and Acer CD620A (20X speed). Hddriver 7.51 recognises Acer drive, but it has not driver for Atapi CD ROM read and DOS extension for ISO 9660.

Pera

Well I know of another person who reported about a few bugs in the compiler and
a few weired stuff it did but nothing were fixed. Maybe he talkde to the wrong
person. Also, I belive that most of these things doesn't realy cause any larger
problems and I have not found any bug I can remember in teh editor. There is
one thing which makes MagiC crash though. You can't save the setup. :-\

Hi Nicholas...!

The only way I can think of that he might be running TOS 3.0x on a Mega ST is if he has the PAK68030 installed. (and TBH, there are not many of those around, eh?) ;-)

About I-Net...sure does! <lol>

http://quickfaq.atari.org

Much easier to remember and to communicate.

Because this a rerouting subdomain, some (old) versions of CAB.OVL will
not cope with it. The old address is still valid:

http://www.mygale.org/~bales/quickfaq.htm

Cheers,
Nick

Well, the board I'm talking about, the IDEal from TUS in the UK, is
STE-only because it piggybacks onto the 68K processor, which is a square
socketed one on the STE. It then requires soldering of only 4 wires.

Some people have seen this C'T project, but apparently:
- It is in german
- It is unavailable
- It requires a lot of soldering skills

Which sadly makes it unsuitable for 90% of people.

Again, I can't say if the IDEal interface will support CD-ROM devices.

Cheers,
Nick

>Hold down the <Alternate> key after the system begins to start but before the
>hard drive is polled. This works, at least, with an ICD driver.

I have been putting together a second system with a drive, and I had the same
trouble (turns out old GDOS hates NVDI-style ASSIGN.SYS files, and locks up!).
I had used ICD Utilities 6.5.something, and the alt key and control key stuff
did not work for me. However, re-reading the ICD docs showed me that you can
select an alternate partition to boot from by simply pressing the
corresponding letter when the ICD banner appears. This assumes you have more
than the C: partition on your drive, which is the recommended state of affairs
by ICD, HDDriver, and several experienced voices here! I'm sold; saved my
bacon!

oh yes, pacifiST almost runs evrything, but it's hard work.
for games try TOSes 1.0 and 1.4. not higher. and you'll have to try harder
finding the perfect settings for each game.

try http://www.fatal-design.com/cgi-bin/gamesbbs/index.cgi

this is one of the best atari emulation talks, they can help

I have the following magazines and cover disks for sale:

Magazines for Sale:

ST Format Issue 6 January 1990
ST Format Issue 7 February 1990
ST Format Issue 20 March 1991 with cover disk!
ST Format Issue 38 September 1992 with cover disks
ST Format Issue 54 January 1994 with both cover disks

ST Format Issue 58 May 1994 with both cover disks

Atari ST User Issue 61 March 1991 with cover disk!
Atari ST User Issue 76 June 1992 with cover disk!
Atari ST User Issue 77 July 1992 with cover disk!
Atari ST User Issue 82 December 1992
Atari ST User Issue 84 Februavered with bits of floating pond plants. Standing there, you could imagine
there being a huge hole underneath you..
Alderley Edge is a small village about 10 miles south of Halebarns. It's
extremely pretty, and gets it name from an 'edge', a few hundred metres
down. There are many huge caves in the cliffs there, and it is an area where
witches are known to congregate. Satanists are also supposed to frequent the
area.
Finally, at Speke Hall in Liverpool there is a ghost of a lady who threw
herself ouugust 1991 with cover disk!

Cover disks without magazines:

Atari ST User May 1990
Demo of Robocop 3 and Double Dragon 3
ST Format Cover Disk 26
ST Format Cover Disk 44
ST Format Cover Disk 2
ST Action Games Disk 6
ST Action Games Disk 36
ST Format Cover disk 8

Hold hard, I think you're moaning at the wrong person. I used to work for HiSoft but now work for a company providing risk management software for banks, finance houses and hedge funds.

Regarding your comments, I really don't think you're doing justice to companies such as HiSoft who have stuck with the market while others have left it. You must realise, or maybe you don't, that economic and market constraints determine if updates can be performed not users. If this wasn't the case, companies would simply cut their own throats and go bust - is that what you want? Would it make you feel happier to think that you had helped in destroying a business?

IMHO companies such as HiSoft, who provide excellent support for ageing products in a niche market place, should not be moaned at by users but should be credited and supported for standing by their user base despite market pressure.

If you want products that are updated on regular basis but come with shitty support then buy a PC, a copy of Visual C++ and ask your doctor to supply a bottle of Vallium for you to take while you sit on hold for support.

As do I - I've put the commands "Connect", "Open", "Disconnect" and "Quit"
onto function keys so all I do is push them in order - needing just a click
on the "Read offline" tool to grab the articles themselves.

375. Megafile 20 on MegaST1 HOWTO update TOS???????????

Newsgroup: comp.sys.atari.st
Date: 1998-10-06 00:00:00 UTC
From: marko@pc-kae.inp-greifswald.de
Message-ID: <Pine.LNX.3.96.981006154528.2756A-100000@pc-kae.inp-greifswald.de>
Source record: 92352

Hi folks,

I was just trying to use my old MegaST1 with a new old Megafile 20
hard drive, but unfortunately the comp tells me during booting from hard drive
that I need to update the TOS... What can I do? I still have the original
1040STF with which I can use the Megafile, but since the MegaST consumes
lesser space I would prefer that computer...

Is it possible just to swap the TOS Eproms of 1040STF and MegaST1? How
do I change the Eproms and where can I find them? I opened both computers, but
there was no label visible telling 'Here I am! TOS 1.02', or something like
that. Anybody has time to tell me how to manage this?

Since I am not a regular reader of this newsgroup it would be very
nice to send response directly via email.

Thanks alot for your help.
I would be really happy if I could place this neat combination of Megafile and
MegaST on my mom's desk... ;)

Bye,
looking forward to receiving hints from you...

Hello,

Is there somebody who knows how to find free alternative TOS copies on the Net?

I have a very old TOS in my pc. So it would be very appriciated to recieve one.

Thanks

Mark

I have a Atari1040 ST with 4MB Ram and one 720k floppy drive
I have TOS 1.0 now

Can't you run TCP/IP directly over an appletalk->ethernet converter?
That would make the connection much faster.

> Good Luck,

One can also connect his Falcon to an ethernet network using the new
Falcon PCI-bridge. I thought it is called 'clipse' and is sold by Titan.
If you then buy an appropriate ethernet adaptor with the PCI Ethernet
LAN Controller DEC21040 or the newer DEC21041 you can use DECdriver from
Marcus Fichtenbauer. It seems AG computertechnik in Germany also sells
PCI ethernet cards that go together with the bridge.
For the (Mega)ST(e) there exist an ISA bridge Phanter. You need to plug
it between the processor and tyhe motherboard. Also here there are
network cards and drivers available.

Seems like ethernet finds it way to the Atari platfrom.

Except Magic, which is commercial, there are no other TOS clones.

You could try MiNT, which is not exactly a TOS clone, as it is very Unix
like, and allows you to run GEM programs in a multitasking environment.
It's a bit tricky to setup though, and probably won't be too great
without a hard drive. It also doesn't completely replace TOS but still
uses the old GEMDOS, which was the buggiest part of the older TOS
versions anyway.

Maybe you could just replace the ROMS. Get newer ROMs from a broken
machine, or buy some TOS 2.06 ROMs from your local(est) dealer. Or go
pirate and make your own ones with an EPROM burner.

Maybe you could even go out and buy MagiC ;-)

Cheers,
Nick

381. Cardfile to Windows 95?

Newsgroup: comp.sys.atari.st
Date: 1998-10-06 00:00:00 UTC
From: "R. Damian Janssen" <krunchy@accutek.com>
Message-ID: <361a3625.0@news.accutek.com>
Source record: 92358

Is there a way to convert Gribnif Software's Cardfile database to something
you can use on a Winblows 95 database? (Excel, Access, or one of the other
contact management programs). I can't get the "message in a bottle" out!
:>

Please respond via E-mail to krunchy@accutek.com

Thanks a bunch!
-Damian

What driver and version are you using ? Maybe it needs upgrading.

I also seem to remember hearing about this message coming up when you do
not have FOLDRxxx.PRG installed.

>
> Is it possible just to swap the TOS Eproms of 1040STF and MegaST1? How
> do I change the Eproms and where can I find them? I opened both computers, but
> there was no label visible telling 'Here I am! TOS 1.02', or something like
> that. Anybody has time to tell me how to manage this?
>

Actually, your STF might even have an older TOS. The Mega should have
TOS 1.02 and the STF could have 1.0 or 1.04.

Depending on TOS versions and motherboards, they can be in 2 or 6 chip
versions. They are only directly swappable if they are both 6 chip
versions. Look for a set of 6 socketed chips marked "(c)Atari Corp" on
each motherboard. Check the date to see which one is newer.

It is possible to swap 6 and 2 chip versions. There's a file about that
in the Quick FAQ, but it requires soldering a wire or two.

You can also upgrade to TOS 2.06 if you find a dealer near you who can
sell them to you. This also requires a little hacking, but is
worthwhile.

In the meantime, I suggest you aupgrade your AHDI from an FTP site, and
put the FOLDRxxx.PRG (the patch against the famous 50 folder bug) in
your AUTO folder.

AHDI 6061
http://www.umich.edu/~archive/atari/Diskutils/ahdi6061.lzh

Rename your SHDRIVER.SYS file as SHDRIVER.OLD, copy over the AHDI.PRG
file to your root directory, rename AHDI.PRG as SHDRIVER.SYS. Keep
AHDI.PRG on a backup disk somewhere.

FOLDRxxx.PRG can be found in
ftp://sunsite.doc.ic.ac.uk/packages/atari/uni-paderborn/tools/util/atariuti.lzh

> Since I am not a regular reader of this newsgroup it would be very
> nice to send response directly via email.

Actually, if you are a frequent user of Atari computers you might find
it quite worthwhile to become a regular user, or at least to check back
once or twice for answers. It's not always practical for everyone to
reply to a usenet article by email.

Cheers,
Nick

Just the opposite here, I quit NEWSie, disconnect with STiK/STinG,
then start NEWSie again if I want to do offline work. Both methods
should work, but since I do it this way, I may not see some of the
problems in doing it your way.

>doesn't rely on any program supporting that feature.

There's nothing to "support" when it comes to start other programs. In
that respect, the StringServer does exactly what the Applier seems to do.
It's when other programs USE of the StringServer that is "support". Like
when i click on a URL in TextView!! (used as an external viewer in NEWsie)
and this URL is sent to the StringServer which again starts/gives CAB this
URL. This is the area in which the StringServer is terribly configurable.

As for the StringServer not working well under SingleTOS, this will be
fixed in later non-beta versions.

>

Did you try this using the StringServer? Or maybe you don't use
Multitasking for this...

True, the StringServer, as it is now, must be in memory. But otherwise it
does all the above in addition to use VA_START if the Destination program
is already running.

>
>Again, not a knock on StringServer, but just pointing out that
>Applier does much of what it does already, and in some ways does it
>better (since it doesn't have to be in memory and doesn't depend on

Still some more to do on the StringServer, ya know :) It's only a beta
yet.

387. booting MiNT 98 and N.AES. HOW?

Newsgroup: comp.sys.atari.st
Date: 1998-10-06 00:00:00 UTC
From: atarist@xs4all.nl
Message-ID: <6vdmtlpcs3@news2.xs4all.nl>
Source record: 92364

Recently (in Neuus) I got MiNT 98.
Reason: the told me that real networking became possible.
And I have Reibl-cards (and also (Bionet).

But the question is:
all my drives are full.
I need a boot harddisk space of 5 Mb and a Minix partition of nearly 40.
So why not using the 44Mb Syquest with the MiNT stuff on it?

But somehow I keep getting stuff from C-drive in the system.

It should be possible to boot from first partion on 44 Mb disk and ignore the existence of C as boot-drive uberhaupt.
But How?
I use HDDRIVER, and I see many ways to do it: options enough.

But can anybody explain to me a 'how to do?'

Uwe, if you read this: should a kind of 'how-to-do-manual be a good idee?
Or a kind of FAQ? You answer in this newsgroup many times the same questions!

Met vriendelijke groet,
Ronald van der Kamp
secretaris Stichting ST

>specifications to connect?

Not in that form.
What you have (19 pin) is Atari DMA (ASCI-Port)
The best method is to fit an DMA-SCSI Adaptor like LINK '98 to that port
and use an external SCSI harddrive.

Otherside, IDE need's a internal interface, also TOS 2.06, if i have
the right informations.

Regards, Robert

No, Steve, it's an old troll. About 51 or 52 years old, to be as precise as possible. David Hunt, aka Duh Shallow, a spam fellow-traveller who has been ripped off by spammers and blames anti-spammers for his own stupidity.

I might add that his vendetta against me as an anti-spammer has cost the US Atari community yet another resource. I'm still supporting the platform passiviely, but I no longer write software nor attempt to handle magazine imports at a net loss as I once did.

392. Neuss Atari Messe ... last week-end in Germany !

Newsgroup: comp.sys.atari.st
Date: 1998-10-06 00:00:00 UTC
From: dipching@ping.be
Message-ID: <361a7c1631c29e0@ping.be>
Source record: 92369

This is the translation of an article posted by me to the
fr.comp.sys.atari two days ago ...

Neuss Atari Messe on Saturday ... I was there.

A lot of things to see and to buy :) .... among other things I can
say all the participants were really friendly, going for the third
time to Neuss (and one more time with my first ProTOS ...), I now can
see that compagnies are recognizing me and I'm really welcome
everywhere even if I don't buy anything :) ...
Some people never met before are really friendly like Sven Behne, one
of the two Behne & Behne brothers both nvdi authors, Sven was really
classic with his cravat and dark jacket, but nevertheless a sympathic
guy :) NVDI (now version 5) has become something very up to date
because it only stays one version for all systems : for Mac, PC, TOS
and/or graphic cards; these latest are recognised during the
installation process and then nvdi adapt itself to their usage ...
so, Nova, Matrix, and Crazy Dots users have only to fill a special
dialog when it appears during the installation ... Beside this brand
new functionality, the available printers number is simply enormous,
and you can select as much of them during the installation ... Bravo
for this latest version !

While I was there I have updated a lot of very good software always
up to date:
-Smurf is available with 1.05 version and this graphic editing
program is really powerfull, Christian Eyrich is really sympathic and
above all very capable.
-Papillon is available with version 3 but needs absolutely nvdi 5,
otherwise, the opened files will only open an empty window ... ASH
didn't cause any problem while updating from a very old french
version.
-PixArt is now version 4.5 and seems to dive further in masks managing
and also effects ... already announced ... version5 ...
On their stand (PixArt), Nima Montaser from Homa House Systems, who
created the famous Infopedia, was discussing with PixArt authors and
demonstrate the brand new ScanX PRO scanner driver which is really a
little marvel now ... just about that I saw Centek team looking at
this scanner driver ... they have one called Sandrine but it only
works on Falcons ....
-Centek of course with their CT2 were attracting a lot of falconists
(I'm not really one ...) and Saturax, a friend of mine is come back
home with his own CT2 32 Mb fast ram equiped ... the Centek stand was
really nice and the video demonstration they were showing proved the
big acceleration amount CT2 gives to the good old Falcon ... bravo !

-Not so far from there Joe Connor from Atari Computing was proposing
english sweeties and we bought at the same time alls the AC issues we
didn't yet have ... a really great magazine that I really counsel to
everyone : serious articles about serious projects ... Joe was really
sad about Godefroy de Maupeou disappearing from the french Atari
market ... here we agree and we really would like to know the truth
about this subject ...
-Of course, Bradley Koda from Bestelectronics was "au rendez-vous",
but his prices are sometimes very high ... though not this time
because the dollar was not in its good days :) ...
-16/32 Systems from UK was presenting a whole bench of Jaguar and Lynx
games ... we gave him a photo taken last year ... he rolled on the
floor laughing because on the picture he was holding some beer glass ...
-At R.O.M russian Papy :), it's the queue and disorder ... one hour
and half waiting to receive a copy of the brand new Papyrus 7 and
discovering back home that disk 2 is empty :(...
This program is so evolued that it allows to display web pages and
edit them ... in one word ... astounding !
-Portfolio clubs are always there ... great Portfolio fans I must say
... but for this time I will wait next year to buy the backlit
display kit because german money disappears like little breads ...
(that's a french expression ... I don't know the english equivalent :)
-Saturax buy the latest Delta Labs CD-ROM called ... hum ... I don't
remember the name right now :(
-At Aixitt, the brand new TT030 TTram expansion card is at last
available :) up to 256 Mb ! for about DM 175 ... hum yes ... next
year I will ... I must keep some money to go the Neuss Mac Donalds if
I want to stay alive ... it's already 14.20 !!!!!
-EDV-Systemli¿½sungen were proposing Photoline 2.30 update and also
promising some quite exciting new development on this program !!!!!!
avec un sourire tri¿½s enji¿½leur en promettant que le logiciel i¿½voluerait
On the same stand a Mint 98 CD ...
-Atari gebraucht-fachmarkt from Peter Denk was really impressive : no
more than about 30 second hand B&W screens and about 50 second hand 1040s
ordered aside from aside ... an atari wall ... the second hand market
is now rebirding but also for the prices :(... in a little show-case
I see some memory expansions at good prices : Magnum ST and ST ram TT
expansions ... I buy one of the latest to solve my printing problems
with the atari laser : 8 Mb ST ram for TT ...
Behind the tables the stand background is full of shelves filled with
atari related books ... hum ... all in german ! :(
-Milans everywhere and not much Hades it seems ... the Milan's
desktop is nomore B&W and displays Ming, a special version of Thing
... high in colors ... I can't say more about the beast excepting I
saw Nima Montaser demonstrating Infopedia on one of them ... Milan
Gmbh stand is always full of visitors ... I'm less curious than them
because I already own two nice TTs ... and ... my billcase is almost
empty ... I must absolutely keep some DM for the Mac (not for iMac
but Donalds mac :) ...
It's now two o'clock PM and we decide to go back home ... 350 Km

higway are waiting for us ... and we think about people who will have
to ride much more than us to come back ...

That's it, it was simply my personnal Neuss impressions ...
An excellent day at Neuss Atari Messe ...

Sorry for bad english langage because I didn't have so much time to
look at the translation but Neil Roughley asked me to translate my
visit ... so there it is :)

Jo

393. MPEGDSP Player question

Newsgroup: comp.sys.atari.st
Date: 1998-10-06 00:00:00 UTC
From: guitarra@afn.org
Message-ID: <6vdtiq$s6s$1@maya.ece.ufl.edu>
Source record: 92370

Hi friends:

MPEGDSP player works very well but needs more speed at full
screen. I have this question:

Is it possible to make the player output the Mpeg with a smaller
screen size? What I mean is, that if the Mpeg file was played not at full
screen this would make screen updates much faster and maybe give room for
audio as well in future versions.

Is there a parameter to control size of the Mpeg in this program?

Thanks, Raymond

Euch which version of SL are you talking about? I've SL 95, 96 and 98 and
there is only a CTX import driver (cal_ctx.cit) but *no* CTX export
driver.

Strange it is. I just downloaded the prg again. At first it wouldn't start
at all, even with the Swedish resource.

After a reboot of my system the prg worked with the English resource.
For your information I'm doing this on a Hades 060/ET6000 graphic card
running NovaVDI 2.61/NVDI 5.01/freeMiNT 1.15-beta-3.0/N.AES 1.1.7/Thing
1.27.

Peter the technology in hooking up your falcon is not available but through
Xircom in Calabasa, CA.. You must have a parallel port to your computer in
order to hook up the extension.

There's a freeware CardFile 4 to Windows 3.1 cardfile converter
available. If one of your Win95 programs can read the older Windows
cardfile format then you're in business:

A real good mouse accelerator is Silkmouse which is availible on FTP sites
containing Atari software.

And as for your other question, simply use the Control Panel accessory and
click on the button that looks like a "C" key to turn off the noise and save
your desktop. Much easier than butchering your machine :)

I don't know how well MagiC works with those programs, but I can tell
you that it's by far the single greatest software purchase I've ever
made. It's like buying a new computer. It's faster, more powerful,
easy to install and use, and has excellent preemptive multitasking.

>and this URL is sent to the StringServer which again starts/gives CAB this
>URL. This is the area in which the StringServer is terribly configurable.

Okay, it's starting to become more clear where StringServer shines.

>>For example, using Applier, if I double-click on a JPEG file in Ease,
>>it loads a MUPFEL script, which temporarily renames the file to
>>temp.jpg (since the Apex viewer can't handle long filenames), loads
>>apexjpg.ttp, and then renames the file back to its original filename.
>
> Did you try this using the StringServer? Or maybe you don't use
>Multitasking for this...

I use MagiC all the time, but I'm not sure what advantage StingServer
would provide here. What did you have in mind?

> True, the StringServer, as it is now, must be in memory. But otherwise it
>does all the above in addition to use VA_START if the Destination program
>is already running.

I can see where that could come in handy. Applier was written before
there was any such thing as VA_START.

> Still some more to do on the StringServer, ya know :) It's only a beta
> yet.

Understood. I hope you didn't take my comments as criticism.

Thanks for your comments and good luck with further development.

407. CAB & Connect

Newsgroup: comp.sys.atari.st
Date: 1998-10-06 00:00:00 UTC
From: mike@mbedford.demon.co.uk
Message-ID: <907705444_OASIS_@mbedford.demon.co.uk>
Source record: 92384

I would be grateful if someone could point out where I'm going wrong.
I'm using CAB 2.5 and ICONNECT. ICONNECT logs on to Demon OK. Once logged on CAB works fine as long as its only local files that are accessed. If I try any external URL's the system locks up. The dying message from CAB is "resolving host".

Thanks in advance for any advice.

: Joshua

This is NOT an official announcement, but I want you to know that Mario
is now in the circuit design stage of making a graphics card/accelerator
which will work on the TT030. It will be made initially to work on the
ST/STE with the idea of bringing the machine into the 'modern world' so to
speak. You will then be able to plug a SVGA monitor into it and use the
internet and have decent graphics. With the new CPU it will be faster than
the TT030 also.

TT030 owners will get more than the usual 16 colours for a change - and
the full screen being used for a change!! Not to mention photographic
quality graphics... CPU upgrade to boot...

So if you can wait or spread the word to other TT030 etc owners we would
like to know how many would buy this upgrade and how much you would pay.

I mean, if you want to pay, I'm sure Mario will upgrade the CPU to a 68060
if you want. I can't wait for him to finish it!

Other serious suggestions are welcome.

I'm using his PC mouse adapter and I'm most impressed. Especially using
the Genius Net Mouse with the double click and left-click-and-hold on the
middle rocker-button. I didn't realize how it makes the computer easy to
use, you don't realize it 'til you try it!

Yes, certainly this can be done!
Mario has installed his upgrade in several machines now. IDE hardrives in
the STFM! For practical purposes, the 2 1/2 inch HDD is ideal. I am not
sure if his upgrade is officially announced, but I have seen the upgrade
in several machines, including a Mega STE with a 5gig IDE drive!

As you should. The frozen lockup could be the result of StinG's
address resolution going south, because it still thinks there is a
conversation between the news server and NEWSie, but NEWSie has been
clobbered. NEWSie is a 'fresh' version, and will attempt to open a
new connection with the news server. Just a possibility.

Hi kaj,

You can still get the STYLES DISK #5 from PG Music for the Atari.
It's well worth it.

Also, there is a Floridian that writes and sells his own styles called
Norton Music's Better Band at:

http://members.aol.com/NortonMIDI/index.htm

Hi Frank,

well, the CTL-ALT-ESC sequence was something I accidentally found out:
Newsie froze up after extracting a file, so I figured I needed the
taskmanager to kick it out, but what happened was it simply unfroze, no
taskmanager window coming in and I could continue my work :-)

Tell you, I never quit Newsie before closing down Sting (not a very
practical way of operating either), unless I don't need it any longer. I
figured out Newsie needs the "disconnect from host" option first, then I
disconnect Sting and continue in Newsie for the reading etc. Has worked
fine ever since I use Newsie.

Hi Jason,

looking at the headers I see you're using Microslop stuff.... if you got a problem with THAT one, you're in the wrong NG!

It wouldn't harm stating what gear you're running, but I take it you're having problems with Newsie.

So, check your settings: in the newsreading options you can set the numbers for maximum articles to fetch and to show somany most recent articles. Got them on 200 and 500 here, but it's all up to you. Also check the create/collapse threads settings. If you set max articles to 1 and also show = 1, no wonder why you get only 1 article in your overview :-)

Wouldn't harm reading the docs, really. (Yep, I know, I can point fingers at myself too, but still...)

> VGA monitor to my STE.
>
> Thanks in advance,

You have to check that your monitor supports the monochrome scan rates.
Colour modes are out of question on that monitor.

Connect the pins together. It should be something like : R, G, B, H-sync
and V-sync. Connect the mono detect pin to ground.

Pinouts and scanrates can be found in the Quick FAQ

If you get it wrong, you can blow up your monitor. Besides, display
quality is better on a proper monochrome screen (Atari SM124, 125 or 144
only). If you want colour, connect to an RGB monitor or a TV, not a VGA.

Cheers,
Nick

Indeed LAN technology must precede the Falcon by a good ten years.
And the technology of the Falcon's LAN port is not obsolete, but -
correct me if I'm wrong, Peter - it is not electrically compatible
with the physically similar LAN port on Apple machines. Thus a
Falcon cannot connect to an AppleTalk network, whereas a TT could,
given appropriate software.

The Mon low-level debugger is supplied, complete w/ extensions for supporting
source level debugging.

You can single-step, set conditional breakpoints, search memory, move memory and
much more.
Multi-windows allow you to inspect the processor's registers, memory locations,
disassembly and C source code, using line numbers to debug your C program.

You would need to talk to Lattice Inc about a poss. upgrade. But I doubt this will happen.... The user base on the Atari isn't large enough to support this - sorry!

g campbell@zetnet.co.uk (f) writes:

> I was wondering whether anyone out there can help me wire this Tulip 14'
> VGA monitor to my STE.

Read the Quick FAQ referenced in Nick Bales' sig.

Here's a clue:

ST VGA Function
11 1,2,3 Mono video out -> R,G,B
12 14 Vert. sync
9 13 Horiz. sync
13 4--11 Ground
4 Mono detect, connect to ground

This works fine for me with an SVGA monitor, but some VGAs may expect a
"combined sync" signal (requires a couple of diodes), and some may just
refuse to listen to the STe.

R,G and B together in the monitor end, this bunch to mono out in the
Atari end; H-sync to H-sync, V-sync to V-sync.

>Connect the mono detect pin to ground.

> Pinouts and scanrates can be found in the Quick FAQ

There they are; just wanted to check you don't connect EVERYTHING
together ;-)

> If you get it wrong, you can blow up your monitor. Besides, display
> quality is better on a proper monochrome screen (Atari SM124, 125 or 144
> only).

Definitely. The only problem is, nobody wants to sell them anymore :-(
Anyway, you can get quite good results vith a good SVGA.

prunus@post3.tele.dk wrote:

: Is it possible to connect a Falcon via the Lan port to a Mac via
: the ethernet port on the Mac?

If you run appletalk instead of TCP/IP, you can connect a Falcon to a Mac, or a Falcon directly to a appletalk->ethertalk converter. Unfortunately this is not very fast... And as far as I know only Linux68k can do appletalk on Atari at the moment, although MiNTNet would be capable of it if the right drivers existed.

: If so, - can I surf on the intenet using IE or NS on the Mac, via the
: Ethernet and the internet connection on the Falcon?

A better solution is to fit the Falcon with a parallel port ethernet adaptor. Currently only use of the DE-600 (and DE-620) adaptor is possible, although I have a RTL8012 (which is better and more common) and am working on a driver for it, together with two French guys...

Good Luck,

I still don't get it. Are you saying that you can set brakepoints in your
C source code in Mon??? This is new to me. :-)

Anyway, it doesn't realy matter as it doesn't work on my GFX card in the first place.

Just for anyones information this is what I currently know about my
Atari Sparrow.

Dark Grey ST case
Light Grey ST keyboard
14 megs ST ram
40 meg Conners IDE internal drive
1.44 floppy
TOS 2.07
And has all usual Falcon ports.

Software on HD:
Sparrow AHDI 5.0
Atari mouse Accelerator 3 v3.3
Atari DSP Host Routines
Atari Super Command
Mint 7.1
and other atari software.

Don

>1.27.

Good news. Your setup has very little in common with mine: MSTe
Geneva+Neodesk NVDI4.

It does prove that it is possible (and easy) to write compatible
programs with old GFA Basic and the Face Value engine.

Interesting is that I have seen the same thing happen once here too:
Everything ran fine, launched CTX-HTM.PRG and total freeze. This was
after running all the Internet progs: Okami, News- & Popwatch, Sting,
QED and CAB.

I do know there is some instability in Sting. I have seen it crasch
severely here running on my router during ftp between other machines.
This was on a "fresh booted" setup.

Also Okami locks up completely after some time if I use pgp.

> >
> >Thanks in advance.

Well, in fact YOU did have no luck but I do,
I run Logic 2.01 and Logic Audio 2.0alpha under Magic 5.13 all the time!
The only thing is with NVDI to check the LineA and I must admit it sometimes
doesn't handle the instr icons well in color but is just fine in B&W
BTW, it's better to use NVDI 2.5 as it uses less memory and u don't need
the TTFonts in Logic. but it works fine with NVDI 4 and the 5 demo too.

For Qbase it's true that it doesn't work at all but who wants to use Qbase
anyway ;-P

440. Lino in New Zealand

Newsgroup: comp.sys.atari.st
Date: 1998-10-07 00:00:00 UTC
From: atarist@xs4all.nl
Message-ID: <6vfcru$85a$3@news2.xs4all.nl>
Source record: 92301

Is there anyone in New Zealand reading this and can check the
following story:

Lino (or Ultre) Photosetters are rented uit .
Now they are old and are being replaced with new stuff.
Nobody wants those machines. They are DESTROYED.

This is awfull!!
I will explain.

One of the big uses of our computers is DTP
We have Calamus for professional quality.
But however beautifull stuff you make at home:
when you want to publish it then: where to find a shop that can use
the Calamus-format documents?
For good quality there is needed 1270 dpi for offset b/w
and 2400 dpi for color printing.
With a special machine using photographic film and paper that is done.

Use a TT, load the job-version of Calamus an have the Lino stter
connected to the SCSI-port.
Load the Ultra-setter printerdriver and there you go!

But there is no firm anywhere in Holland that has this hardware
AND want to help home-users of Calamus.
To keep Atari going for professional quality use: a Calamus print-out
service is needed.

This is the reason for my question: are there anywehre those
photosetter machines for sale?

Met vriendelijke groet,
Ronald van der Kamp

Hi Ronald,

AFAIK Okami supports PGP... the issue isn't out yet but I reviewed Okami
for ST nr. 76... you must have come across it whilst doing the lay-out for
it :-)))

443. Is there a Perl for the Atari (TT)?

Newsgroup: comp.sys.atari.st
Date: 1998-10-07 00:00:00 UTC
From: cwesterh@dds.nl
Message-ID: <361b567d.3488575@news.nl.net>
Source record: 92304

In principle I am going to work with Perl under Windows and Unix. I
was wondering if there is also a version for the Atari. Then I could
use scripts made on the PC or the Sun also on my TT.
Thanks.

Cecil.

Yes, Perl is ported to TOS. Try...

ftp.funet.fi/pub/atari/piwo-mint/Programming/Perl/

You need tar and gzip (also on funet) to unpack it, and possible MiNT
to run it. Read the docs.

In defense of Terry, I understand why his initial thoughts were that of Applier. The whole concept of StringServer takes some time to grasp (even though the docs are well written). Terry was honest with his first impressions ;-)

After a fairly long session trying to 'grasp' things, all I can say is that StringServer and TextView!! are absolutely brilliant.

I hope you can get this resolved. I remember what a pain in the
sitter PageStream could be about such things.

For what it's worth, the memory-limiting option used in Geneva
did, indeed, keep PGS from grabbing all available memory. I
know that doesn't help you, but it does indicate that PGS _IS_
controllable.

: > one.
: >
:
: Except Magic, which is commercial, there are no other TOS clones.
:
: You could try MiNT, which is not exactly a TOS clone, as it is very Unix
: like, and allows you to run GEM programs in a multitasking environment.
: It's a bit tricky to setup though, and probably won't be too great
: without a hard drive. It also doesn't completely replace TOS but still
: uses the old GEMDOS, which was the buggiest part of the older TOS
: versions anyway.

Are you sure you don't have that backwards? Surely MiNT is a replacement
GEMDOS (still using the old BIOS, XBIOS, VDI and AES).

: Maybe you could just replace the ROMS. Get newer ROMs from a broken
: machine, or buy some TOS 2.06 ROMs from your local(est) dealer. Or go
: pirate and make your own ones with an EPROM burner.

A 2.06 update kit would seem like a good move.

Yes, it's a pain. Take this tip: start by soldering the wires that go to
the middle pins.

It's an encryption system. PGP stands for Pretty Good Privacy.

> Is it worth setting PGP up?

It depends on the sensitivity of the stuff that goes through your
mailbox. It also depends on your country's laws and regulations. Here in
France, unregistered use of encryption programs is assimilated to use of
military weaponry.

453. Sting remote control for Win-95 for download

Newsgroup: comp.sys.atari.st
Date: 1998-10-07 00:00:00 UTC
From: kennethm@tripnet.se
Message-ID: <361b84c43fb600@tripnet.se>
Source record: 92314

I have just uploaded a little utility program for Win-95 to those of
you who runs Sting on Atari and have a pc connected to your local
tcp/ip network. The program is a simple remote control that lets you
dial in to your ISP without leaving the pc.

Unfortunately Windows program has a tendency to grow slightly bigger
than Atari ones. The complete .Zip is 2.21 MByte but if you already
have VB5 installed you may get away with only the .exe at 6.26 kByte.

You can get it from:

http://www5.tripnet.se/~kennethm/sting-remote/sting-remotee.htm

or via a link at my main page.

From: Guido Vollbeding <guivol@labsoft.de>
Message-ID: <361B9AB2.B89A7685@labsoft.de>
Source record: 92322

MPEGDSP is an *approach* to a full-featured MPEG player!

Much efforts have been spent in its development, but much
more would be required for a full-featured version.
Unfortunately, there was not enough encouragement in the
Atari world to justify this, sorry.

If you want more options (full frame support and resize),
use 1stGuide. If you want more speed, use it on a fast
system. Itï¿½s not 1stGuide that is slow, itï¿½s the hardware.
Much efforts have been spent to optimize the MPEG (and
other) routines in 1stGuide, more than is necessary on
other systems today, where it is easy to achieve real-time
software MPEG playback on standard configurations without
much optimization.

Date: 1998-10-07 00:00:00 UTC
From: glennwilson@my-dejanews.com
Message-ID: <6vggr0$ik0$1@nnrp1.dejanews.com>
Source record: 92326

My old but beloved atari 1040 ST has developed a problem (BIG) - when I hit a key I get one or more letters/numbers/special characters other then the key am hitting. I fear either the keyboard or the motherboard has died... Has anyone encountered this problem?

My wife wants to trade the poor dying beastie in for a MAC so we can have both IBM and MAC machines for the kids to use like they do in school. Our 'other' computer is a Compaq.

466. Mega ST keyboard wiring and IBM usage

Newsgroup: comp.sys.atari.st
Date: 1998-10-07 00:00:00 UTC
From: Dave <route@hitter.net>
Message-ID: <6vgc57$6f5$1@supernews.com>
Source record: 92327

Help! I have the opportunity to get a Mega 4 without a keyboard or mouse.
My question:
'I have totally forgot where the mouse attaches.... Does it go to the
keyboard similar to the 520/1040 or does it go to the main desktop unit
itself?'

2. I remember faintly that they used a RJ11, RJ13, or RJ45 coil to connect
the keyboard to the main unit. Which one was it???

3. Anyone have any luck crimping an RJ connector to an IBM keyboard and
have it function properly???

E-mail - route@hitter.net or reply to this newsgroup

thanks,
Dave!!

467. Atari hardware & software for sale.

I have an Atari STE , an Atari Mega 2 and loads of software to get rid of.
There are other bits of hardware
also for sale. If you are interested email me and I will send you a complete
list. I am open to offers for
anything youwant from my list.

If you really want to make e-mail private you have to encode it with
PGP.
Nobody can read it only the recipient.
Also can he become sure that you are who you say you are.

There are some countries where it is forbidden to use because
the local yokels of the 'security services' needs to be able to read
your mail.
I was told that in France you can go to prison for years!

So make your choice!

I just purchased a used FALCON and am now on a search to find programming references for it. ASSEMBLY stuff would be most helpful, and anything on the DSP would be good too.

Anyone know of any really good references?

From: msteve@cis.ohio-state.edu
Message-ID: <6vgjjdfba1@news.cis.ohio-state.edu>
Source record: 92333

I picked up a FALCON a few weeks ago and found out that my C-LAB notator won't run on it. Not that I expected it too, but it would have been nice.

Is there any comparable MIDI software that is hard to find, fairly expensive, or not supported which is comparable or better than C-LAB Notator (which consequently is hard to find, fairly expensive, and no longer supported).

Hi Steve,
If you're most comfortable with Notator, you should get Logic Audio, which was the sequel. I prefer Cubase Audio, but it's all a matter of taste. Some things are better in Logic and some are better in Cubase...
Check out my homepage to see my own studio and maybe learn something more about the Falcon.

Best regards,

Jeff Pedersen wrote:
>I'm looking for more MIDI Input/Outputs for my Falcon running Cubase Audio.
>Also interested in SMPTE.

Hi Jeff,
There aren't many units to choose from. The old Midex/Midex+ don't work since the hardware in them is too slow (there is a driver available, but Steinberg said that you won't get full capacity from the computer since it has to wait for the expander to catch up...). I use SoundPool's MO-4, which gives me 4 extra midi outputs from the printer port. On the input side, it's a little more difficult. You'll probably have to use a merge box to get several midi inputs.
SoundPool have a box that can sync to SMPTE, so if you have a stable system, it should be possible.
BUT! When it comes to syncing to tape, it's a tricky business. If you want to use an ADAT, there shouldn't be much trouble (there is a box available from Steinberg for syncing to ADAT). You can probably sync to harddisk recorders via midi clock or SMPTE, but if you want to sync to a reel-tape or portastudio - forget it! I know many people who have tried and tried and never got a perfect result from it. The problem is that the only time audio and midi are in perfect sync in CAF is when you hit Play. After that, the audio is "free-wheeling" and is no longer locked to the midi, so the midi will follow the tape's SMPTE when the speed varies, but the audio will get out of sync rather quickly. One way to go around it is to record only short pieces of audio and try to place them manually in sync when playing the tape. It won't get perfect, but after much work, you'll probably have an acceptable result.

Best regards,
Claes

Cubase - by Steinberg. Version 3.1 is about the latest normal version

or Cubase Score 2.6 for the one with all the scoring features.

It is a full professional quality sequencing programme and should run
fine on the Falcon.

I have no idea who supplies it in the States, but it is stil available
from a couple of suppliers in the U.K.

>external application?

You can't. I thought I made it pretty clear that Applier extends the
power of the installed application. While StringServer also does
that, it's been pointed out to me that it does much more than that.

>>Understood. I hope you didn't take my comments as criticism.
>They were imo. As they were not truely honest as you didn't see the

Because I didn't understand the power of StringSaver does not make my
comments dishonest. I was 100% honest in everything I said. I even
said up front in my original message that I might be missing
something. In what way is that dishonest?

SS SS tt ee ll ll aa aa
SSSS ttt eeeee llll llll aaaaa

================================================================================
Release 1.0 for DOS, Linux, and Unix
================================================================================

The Atari 2600 Video Computer System (VCS), introduced in 1977, was the most
popular home video game system of the early 1980's. Now you can enjoy all of
your favorite Atari 2600 games on your PC thanks to Stella!

Stella is a multi-platform Atari 2600 VCS emulator written in C++. Stella
allows you to play most of the games written for the Atari 2600 including
Supercharger games.

This is the 1.0 release of Stella for DOS, Linux, and Unix. Distributions
for other operating systems will appear as they become available. The three
distributions currently available are:

* Binary distribution for Linux (stella-1.0-linux.tar.gz)

* Binary distribution for DOS (st10.zip)

* Source code distribution for Unix and DOS (stella-1.0-src.tar.gz)

A few 2600 ROM images, BIN files, are included with these distributions.
BEYOND THESE FILES NONE OF THE DISTRIBUTIONS CONTAIN ANY 2600 ROM IMAGES.
PLEASE DON'T WRITE ASKING FOR ROMS BECAUSE THEY ARE COPYRIGHTED! If you
own any of the Atari 2600 Action Packs by Activision you can use the ROM
images from it with Stella.

New in this Release
==================

* Supports Robot Tank and Decathlon

* Supports Joystick, Keyboard, Booster Grip, and Indy 500 Driving
controllers

* DOS version supports 320x200 and 320x240 graphics modes

* Preliminary support for Chris Wilkson's Megacart bank-switching scheme
```

* Improved graphics emulation (TIA)

* Improved timer emulation (6532 PIA)

* Improved CPU emulation (6502)

* Improved Supercharger support

Distribution Site
=================

The Stella distributions can be obtained from the Stella home page at:

http://www.classicgaming.com/stella/

If for some reason you are unable to connect to this page please try
again later.

It's a part of the StringServer-distribution, so you'll find it in the
same directory as StringServer itself.

Btw. TosWin2-users might find this interesting: I've added
StringServer-support to the latest (unreleased) 2.3b, I hope that it
will be integrated into the official 2.3 when it's released.

Source record: 92387

Hello,

I'd like to connect my Falcon to a little TCP-IP network of PCs.
I'd like to use a null modem cable and use STING on the Falcon.
On the PC I would like to use NT4 and the RAS Service or Linux with either a
PPP or a SLIP server.

Did anyone ever try that and found a correct config for STING ?
I'm having problem with the NT4 (well I know it's quite usual) and RAS
solution : even though I tell him to accept non crypted passwords (so that
includes PAP protocol) the Falcon doesn't seem to "dial" the PC.

Any suggestion ?

Thanks in advance

486. The Eagle TOS compatible computer

Newsgroup: comp.sys.atari.st
Date: 1998-10-07 00:00:00 UTC
From: mb@tos.pl.net
Message-ID: <XPB3CMH@tos.pl.net>
Source record: 92388

Looking back at a past Atari World magazine (June 1995) I notice a prominent article on the Eagle, a TOS compatible computer from GE Soft.

According to the article, the motherboard contains most of the standard ST and TT compatible stuff, but the CPU is on a separate card. Upgrading to an 040 or 060 would be as easy as plugging a new CPU card into one of the Eagle Channel slots. It came with a Mach64 graphics card and a 030/68882 at 32 MHz, and also had a card for VME slots. They said that the machine was very compatible with existing software, and worked generally very well.

Who is GE Soft and where is the Eagle? Does anyone know what happened to this remarkable machine?

488. Re: StringServer is out!!

Newsgroup: comp.sys.atari.st
Date: 1998-10-07 00:00:00 UTC
From: Katherine L Ellis <kellis@primenet.com>
Message-ID: <Pine.BSI.3.96.981007015313.14429D-100000@usr06.primenet.com>
Source record: 92390

I hope you both don't mind I throw my 2 cents worth in this thread.
But I think I had to say something.
1) I have never used/heard of applier so Terry could you answer this
question:
How do you do to send special strings imbedded within a program to
external application?
In example, on irc, someone comes up and says: "Hey check out my page
at http://www.blah.com very nice one!"
I don't think applier is even the same type of application as
stringserver. Totally different type of app from what I understood of
applier.
With stringserver, you just take your little mouse pointer, and click
in atarirc window on the line you want to process. Here
http://www.blah.com
Stringserver will analize this string, and will forward it to the
appropriate application (CAB for example)

Same example, in airc someone says, yes email me this beta to this
address user@blah.com , use your mouse, click on the address, and
stringserver again will analize this string and will forward it to the
appropriate application. (newsie for example)

I could write you a 50kb long email full of example, and hope you see
that applier<>stringserver by all means. (unless I am totally wrong
about applier).

Textview is 1) the best/fastest ascii viewer we have.
2) it fully supports stringserver protocol. So use textview as default
viewer in your desktop preference, or newsie, or whatever...
when hallvard post his ftp update list in comp.sys.atari.sys, since
textview is set as viewer, Just directly click on his message to the
ftp:// and there you go :) aftp takes off with the correct address etc
etc :)
possibilities are endless. This protocol opens new door for coders and
users.
You go Odd Skancke, you the man!.

>Understood. I hope you didn't take my comments as criticism.
They were imo. As they were not truely honest as you didn't see the
power of stringserver.

I have 5 atari ST mice. $35 shipped(usa) or Best offer over $35

These are untested but the 2 that i am keeping work just fine(I converted them to work on my amiga).

>of ram allocation there is on a falcon (since I don't own one ..YET!)
>But this might be a clue.

I have it set up to only use ST RAM already, but thanks for the suggestion.
And I don't know if this flag setting has any affect on a Falcon, but I did
set it just the same (with MaxiFile III).

Interestingly, I find I can get between 70Kbytes and 900Kbytes free by varying
the amount it's limited to (with the actual limiting amount used seemingly
irrelevant!). If I limit it to 1000Kbytes or smaller, I have less free RAM
than if I limit it to 4000Kbytes. :^O

I've found it eats the least RAM when I limit it to around 2500Kbytes...

493. Old Atari user becoming new MIDI user

Newsgroup: comp.sys.atari.st
Date: 1998-10-08 00:00:00 UTC
From: "Jeffrey S. Jewell" <jjewell@ix.netcom.com>
Message-ID: <361D863A.1F8989C3@ix.netcom.com>
Source record: 92195

I've always used my Ataris for games, now I'd like to start using them for MIDI. The "biggest" machine I have is a Mega 2 ST (although I've got a 520STfm upgraded to 2.5 megs of memory). I've got a good sized hard drive.

I'm a guitar player, singer, and song writer, and I've recently gotten a Tascam 424 Mk II. I've also got a Casio CT-670 lying around.

I'd like to use the ST to plays drums and bass on the CT-670 for me.

Are there any freeware sequencers that are worth the time to download for this? Assuming not, what would you suggest as a good value in shareware or commercial sequencers? In a perfect world, I'd like something that I could use quickly and easily for the drums/bass part, but flexible enough to do things I haven't even thought of yet, once I get good enough to think of them.

Thanks for any help you can give me,
Jeff

Dave (route@hitter.net) wrote:
: Help! I have the opportunity to get a Mega 4 without a keyboard or mouse.
: My question:
: 'I have totally forgot where the mouse attaches.... Does it go to the
: keyboard similar to the 520/1040 or does it go to the main desktop unit
: itself?'

The mouse attaches to a connector on the keyboard.

: 2. I remember faintly that they used a RJ11, RJ13, or RJ45 coil to connect
: the keyboard to the main unit. Which one was it???

The keyboard connects to the computer via a connector which looks like a phone plug. I ordered one under the name FCC-68 6/6 connector (6/6 meaning 6 conductors of which all 6 are connected). I'm not sure whether this is the same as any of the plugs you mention or not. Although a phone cable does seem to fit the plug, it doesn't actually work, since the cable on a phone plug is upside down compared to the Atari keyboard cable.

: 3. Anyone have any luck crimping an RJ connector to an IBM keyboard and
: have it function properly???

That will never work, since the IBM keyboard (meaning, I presume, an AT or PS/2 keyboard) is completely different to the Atari keyboard. I'm currently working on an interface to connect an AT or PS/2 keyboard and a serial mouse to the Atari. It should be available before the end of the year. This sounds like what you are looking for.

```
Systems For Tomorrow's October sale
~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~
Octoberfest is coming and we need beer money!

** ALL prices and specials are for October 1998 Only **

Holy Cow! - Sale on Electronic Cow stuff!
~~~~~~~~~
Sale priced at 10% OFF:
EC-909 $35.99
MIDI Arpegiator $25.19
Scribble Synth $26.99
Snippit Synth $26.99
Sound Chip Synth $17.99
Want more? Buy two or more and save an additional 10%!!!!!

CD Mania - Atari CDs from $9.99!
~~~~~~~~
All Things Falcon CD $9.99
Atari Compendium CD $9.99
Crawly Crypt Vol 1 CD $9.99
Crawly Crypt Vol 2 CD $9.99
Crawly Crypt Archives CD $19.99
ESG Atari Clipart CD $9.99
Moving Pixels Collection CD $19.99
Suzy B's 2CD Set (no Jewel) $9.99
Suzy B's Vol 2 CD $24.99

Crawly Crypt Mad Hatter Deal
~~~~~~~~~~~~~~~~~~~~~~~~~~~
Buy Crawly Crypt 1 and 2 or the Crawly Crypt Archives and receive a
Crawly Crypt Baseball hat FREE. You must request the Mad Hatter Deal
when ordering if you want the FREE hat.

Buy/Buy/Free/Free - Classic Atari Software
~~~~~~~~~~~~~~~~~
Buy two, get two FREE! Choose from:
Asteroids Deluxe $9.99
Degas Elite $9.99
Jack Nicklaus Golf $9.99
Legends of Valour $9.99
OCP Art Studio $9.99
Risky Woods $9.99
Rock N' Roll Clams $9.99
Walz $9.99
```

Eaaak, A Mouse! - Faster rodents are harder to catch!
~~~~~~~~~~~~~~~
Wizard 560dpi Mouse $24.99 (Available in Black or Beige)
Wizard Mouse two pack $39.99 (Try breeding them)

Jaguar Games - Prices listed, no math required
~~~~~~~~~~~~
Defender 2000 $14.99
Tempest 2000 $14.99
White Men Can't Jump /w TeamTap $14.99
Zoop $9.99

Trick or Treat
~~~~~~~~~~~~~~
Order by Halloween and receive a FREE candy treat! Yum.

Birds just wanna have fun
~~~~~~~~~~~~~~~~~~~~~~~~
Buy the Amazing "Crown of Creation 3D" for only $39.99 and take
LlamaZap, Pinball Dreams, and or Steel Talons for only $9.99 each!
All titles are Falcon030 Only!

Some price reductions in this post are permanent, others will be gone
with October! Sale prices are limited to quantities on hand.

Sounds like the keyboard is packing up.

>
> My wife wants to trade the poor dying beastie in for a MAC so we can have both
> IBM and MAC machines for the kids to use like they do in school.

You won't get much from trading in a broken ST, I'm afraid. Unless they
start giving away Immacs for free ;-)

> Our 'other'
> computer is a Compaq.

Not something to be particularly proud of, if you ask me.

Trade in the Compaq and buy a Milan, TT or a Falcon. Teach your kids how
to use a real computer, not just to press a Start button ;-) As you sayn
they get plenty of that at school already.

Seriously, get a new keyboard. You omitted to say where you live, and as
most people who forget to say where they live actually live in the USA,
you might want to order a new keyboard from Best Electronics in San
Josï¿½, California.

Cheers,
Nick

>
> Hi Steve,
> If you're most comfortable with Notator, you should get Logic Audio, which was the sequel. I prefer Cubase Audio, but it's all a matter of taste. Some things are better in Logic and some are better in Cubase...

In fact, the sequel was Notator Logic, but this could be upgraded to
Logic Audio. If you only need MIDI sequencing, then the Logic (2.5 seems
to be the last version) is fine. The audio part, however, is quite heavy
and needs the full 14 Mb memory (this is also true for Cubase Audio).
Otherwise it works, but everything is painstakingly slow! They had great
ideas, but the Falcon hardware just wasn't up to these :-(So they
dropped the audio developement for the Atari version.
Basically Logic is Notator with added Cubase features... best of both
worlds, methinks. To an old Notator user it seems impossible at the
beginning, but you'll get used to it. Try to get the latest version, as
the first one had a terrible manual (sorry, nothing personal). The new
one should be better; haven't seen it, though (written in the USA?).

C-Lab split to C-lab (producing nice Falcon clones) and Emagic
(producing the Logic software), if I'm correctly informed.
Emagic supported the Atari platform up to these days, but judging by
their web page (http://www.emagic.de) they seem to have dropped it now
:-((((.

btw, is there anything behind the rumours, that Steinberg is considering
Atari support again with the arrival of the Milan?

Markku

510. [AD] SOFTJEE news.

Newsgroup: comp.sys.atari.st
Date: 1998-10-08 00:00:00 UTC
From: Softjee <softjee@wanadoo.fr>
Message-ID: <361CA006.386B0D4C@wanadoo.fr>
Source record: 92263

Hello everybody !

Here follow some informations about SOFTJEE products. We inform you too, we made a external clock for the Falcon delivering the C.D. and D.A.T frequency.

Thanks to read us.

** A.F.S.

A.F.S is a Audio File Selector allowing you to listen audiofile simplying by clicking on it in the selector. A.F.S can play AIF/WAV/AVR file in D2D. Its very simple file selector allow very quick using in accessory for Cubase for example.

** Audiomid

Audiomid is an audio to midi translater. You can load audio sound (listen it) and translate them into
Midifile. You can immediatly listen the Midifile (a midifile player is incorpored). The display allow you to see in same time audiofile and Midifile (in key edit mode).

Last revision is 1.01

** Easy Beat

Easy Beat allow you to compse easily audio rythms and record them in an audio file or midifile (and Digital Tracker song too...). Easy Beat manage 8 tracks and you can put for each tracks your own audio sound or audio sound from audio banks like TR 808,...gived with the software.

Easy Beat is available in France and Germany. Ask to your current dealer to have it !

** EXPAND

Expand is a Midi Sampler Software. You can load audio sound, make instruments multi-sample and play them with a Midi keyboard or a sequencer.
You can set too the ADSR for each sound, have graphic panoramic setting,...Expand understand the most of Midi messages like note-on, note-off, program change, main volume, pitch, fine,...

You can too put some digital effects on each channel like Reverb, Echo, Chorus,...

Last revision 1.04 with using in screen with 2 colors.

Revision 1.03 with the following function added :
Play AIF in D2D, load WAV, Selecting of External Clock, Frequencies of replay, set repeatt start/end of each sample, set polyphonic voice for each
Midi channel (select automatic for dynamic polyphonic voice or set the number of voice for each channel).

** MIDPLAY

Midplay is a Midifile player which play MID with audio sounds (so you can
hear Midifile only with Midplay and your Falcon). Midplay can play too KAR
file and displays the text of these files. Midplay use a GM kit audio to

play midifiles. You can mute each channel, have informations on it,...

Last revision is 1.06

** Pretty

Pretty is a Midifile Player BUT with MIDI OUT.(this is the difference with
Midplay). You can plays play list of Midile/Dir of Midiles. Pretty have too
severals options like "Record Module" which allow you to record in audio the
Midifile you're playing and "Grid edit Module" to display/change the Midifile.

Last revision is 1.01

** DIGITAL HOME STUDIO (D.H.S.)

D.H.S. is a very big soft allowing you to sample audio sound, sequence audio
sound in D2D or memory/ sequence Midi informations. D.H.S can load 256 samples and you can play them with any note you want. You can put them on
the sequencer or edit them in the sampler. You can apply digital effects in
real times or in the sampler. You can use in the sequencer Midi information/audio sound/Direct To disk sound in the same time. You have too
some graphic function to set main volume of each track, effect level,...

D.H.S. manage 64 voices/ 32 tracks and play at 50 Khz 16 bits.

Now fully compatible with AfterBurner 040

Last revision is 1.07.

** DIGITAL TRACKER 1.9

The most popular/used soundtracker on Falcon. The new version of the DIGITAL

TRACKER
is 1.9 better than the 1.2 distributed by Frontier Software.

To your information, here follow the list of soft and price SOFTJEE
propose
to you. Price are in French money (FF), Dush Mark (DM) and EURO.

The software are available at :
- SOFTJEE

> from the AUTO folder and work immediately for following AUTO programs?

You could give AutoMore a try,
ftp://ftp.cs.tu-berlin.de/pub/atari/Utils/Disk/automrr6.lzh

Caution: At least with NVDI 3, AutoMore didn't catch its output, haven't tried with later versions. Also note that the docs are German only (the program messages and the variable names in the config file are English, though).

AutoMore features other things besides output redirection, e.g. use of different auto folders, wait for keypresses after programs, use autoexec.bat without MagiC, ...

Ciao

> Why don't you set 1stGuide as a viewer for all the files using [*.* or *]?

Do _NOT_ use *.* in Thing 1.2x if you want to match all files. Thing now
uses real wilcards, i.e. *.* would only match filenames with at least
one dot, e.g. README wouldn't be covered, but README.TXT would.

Ciao

That's been answered... but it's so fast that you may never find it ;-)

BTW, Okami can be configured to use TextView. In StringServer's default CNF just change the application in the entry where you see the 'mailto:' field. Or leave it alone and use the existing environmental variable MAIL_CLIENT by adding that to your magx.inf (e.g. #_ENV MAIL_CLIENT=G:\O.PRG).

From: tjendol@wxs.nl
Message-ID: <6vik4a$li9$1@reader3.wxs.nl>
Source record: 92274

Please can anybody help?
I'm running Naes1.2 + Thing on a Milan. Whenever i boot (cold and warm), it starts up in a screen resolution of 640x480x256. But I want it to startup in 800x608. Until now I have to use the change resolution option in Thing.
When I instruct the graphic card driver, anex VDI-driver, to operate in 800x608, the (N)aes turns it into 640x480 again while loading.
So, if I've figuered it out right it is Naes wich sets the screen to 640x480 at boot. Does anybody know if and how I am able to tell Naes to start in a resolution of 800x608?

Also, can anyone tell me why Thing shows icons in 16 colours and not in 256 colours, when in High or True colour display mode?

Thanks!
Karsten

I don't have a Milan so I can't answer your first question, but the reason why Thing use 16-colour icons in truecolour-modes is that there's no *legal* way to know the correct colours for colours 16-255. There is no real standard for 256-colour palettes, I guess that's why Jinnee (which can use 256-colour icons in truecolour) has it's own palette.

N.AES itself also use 16-colour icons in higher resolutions, I don't know about MagiC-AES. Geneva 6 seems to handle truecolour better than both N.AES and MagiC.

Hi!

Karsten <tjendol@wxs.nl> wrote:
> Does anybody know if and how I am able to tell Naes
> to start in a resolution of 800x608?

N.AES uses the resolution stored in newdesk.inf, so you have to boot SingleTOS (hold down shift while booting to cancel MiNT), set your desired resolution (you'll have to quit Thing first, if it's run with SingleTOS, too) and then save options.

It /may/ also help to delete newdesk.inf from C:\, but I'm not sure about this.

> Also, can anyone tell me why Thing shows icons in 16 colours and not
> in 256 colours, when in High or True colour display mode?

That's due to some programming difficulties (Falcon TOS isn't able to do that, either) and will change in one of the next versions, though this will need NVDI 5, then (i.e. without NVDI 5, Thing will still display icons in 16 colors in Hi- or TrueColor-modes).

Ciao

From: guitarra@afn.org
Message-ID: <6vj4re$o5n$1@maya.ece.ufl.edu>
Source record: 92284

Hi friends:

MPEGDSP player works very well but needs more speed at full
screen. I have this question:

Is it possible to make the player output the Mpeg with a smaller
screen size? What I mean is, that if the Mpeg file was played not at full
screen this would make screen updates much faster and maybe give room for
audio as well in future versions.

Is there a parameter to control size of the Mpeg in this program?

Thanks, Raymond

Hi,

some time ago (right after evaluating Jinnee) I found the new update for
Thing still had only icons in 16 colors. So I borrowed some icons from the
Jinnee RSC files, a few in 256 colors. Also I set my standard palette to
the Jinnee one thru' a CPX (even in truecolor). One of the icons in 256
colors is the CAB one and it displays perfectly on Thing's desktop
running from MagiC. AFAIK the Jinnee palette has a few colors swapped,
it's not entirely different from the "standard palette".
BTW, most (90 or more percent) of the icons in the Jinnee file were only
16 color ones...

Other people here have claimed that the bus width is what defines the
computer's 'bitness', but that makes little sense (especially on a
processor with dynamic bus sizing and/or internal caches)!
Also, remember that the Pentium (a 32 bit processor) has a 64 bit memory
bus and various RISC chips (32 and 64 bit) have used even wider ones.

The 68000 (as in the ST) can not do 32 bit operations directly in
hardware, unlike the '020 and up.
Sure, the registers are 32 bit wide and you can do operations on them,
but most (all?) of the old 8 bit processors (Z80, 6800 etc) had 16 bit
registers they could work with too.
The 68000 (and the 8 bit processors) had to make two or more passes
through their internal logic (adders etc) to do the longer operations.
The only useful definition of 'bitness' is the width of the 'native' word
the hardware can actually be operated upon for normal data (not counting
things like FPU/MMX/3DNow! etc).

The 68k _architecture_ has always been 32 bit, but various implementations
have used 16 bit ALUS and 16 bit busses (there was even a version with
an _8_ bit bus (the 68008 used in the Sinclair QL)).

It would be quite possible to build a 68k variant with a single bit bus,
a couple of megabytes of internal (at least 32 bt wide) cache and 32 bit
adders etc. Would you call that machine single bit?
For that matter, RAMBUS memory may well be connected directly to
processors in the future. RAMBUS normally uses an 8 bit channel (running
at several hundred MHz)...

>My knowledge of the Jag is limited but as far as I am concerned the
>databuses were 64bit. The two main CPUs (either of which could

There were data busses of different widths.

>control the whole thing) were 64bit. The 68000 was, of course 16bit,

The only two 'processors' in the Jaguar that should really be called
64 bit are the blitter and the object processor (sort of a combined

screen/sprite unit).
One of the two RISCs could access memory in 64 bit chunks (the other
didn't even have that capability), but no operations could be done on
data of that size.

>but could access 64bit in multiple goes as it were.

Well, it could of course access all of memory if given a few 'goes'...

>So the Jag was 64bit. Those that say it was only 16bit are just

You might possibly call it a 64 bit games system, since two of the parts
that are relatively important for games were indeed 64 bit (see above).
If it had been a computer, that would've been much like calling it 128 bit
just because it happened to have an advanced graphics card, though.

>seeing the 68000 and assuming it is the main CPU. As to why it was

The two 32 bit RISCs make a convincing argument for calling it 32 bit, but...

>only about as powerful as 486DX2-66 with local bus graphics...

The Jaguar should be significantly faster at some things, but the low
clock frequency of the RISC chips (probably (IMO) caused by the single
cycle multiply), strange memory system and the difficulties of using
asymetric multiprocessing weighs it down.
Still, it's quite a nice machine for it's time, IMO.

>>the pathetic caches in the 030 (256 bytes!) the clock-doubling doesn't

2*256 byte caches can make a _lot_ of difference if you write your code
well (which need not necessarily mean assembly).
When the '030 was new 2*256 bytes certainly was not pathetic.

>>mean much, it's perhaps 10-15% faster than a pure 16MHz design.

Naturally, that depends a lot on what code you're running.

>I guess they should have more looked at the Mega STE. A 2nd level cache DOES
>matter :-)

The MegaSTE of course didn't have a second level cache (it was first
level there, even though it was external) and second level caches were
never as common on m68k systems as on Intel ones (possibly because of
the early adoption of split caches like in the '030 and up).
Was there ever an '040 Mac with external cache? I'm not 100% they even
used it on any of their '030 machines (certainly not all of them).

>But at the time the TT bus was at 16MHz, PC's were still at 8...

Uhm, the '386 and the '030 are from roughly the same generation (I
seem to recall the '386 being somewhat earlier) and I really doubt you'd
find many '386s on 8MHz busses...
Perhaps you're thinking about the ISA bus, which was used for graphics
cards and other I/O hardware.

I tried it earlier today, and it *is* a very nice viewer. In fact,
I've already installed it in Ease for a number of filemasks.

>BTW, Okami can be configured to use TextView. In StringServer's default

Do you mean that you can click on a "mailto:" string and TextView
will call up Okami (via StringServer), and give you the send email
dialog? If so, that would be pretty cool.

I'm liking this package more and more all the time. :^)

Yes, I found that out. It's not too big a deal though as now (under MagiC) I just quickly load a couple of APPs before running PageStream, and once PageStream is loaded, quit the other "space holding" apps, and I have free memory available.

Or, since recently realizing how much faster PageStream loads with the fastload bit set for FONT FILES, it's only a minor inconvenience to quit PageStream, load what I need, then re-run PageStream.

One of the most inexpensive (and easy, too!) ways to replace the keyboard of your 1040 is to have someone give you an old 520ST. Thousands of these machines were sold worldwide, and the majority of them were never upgraded with additional RAM or whatever. Those who originally bought them went for the Mega, the TT or crossed OS platforms as their needs grew.

But unless there was serious gaming in the home of the old 520, it probably has a keyboard in decent condition. Changing keyboards in Atari ST's is fairly uncomplicated.

JG

>I've already installed it in Ease for a number of filemasks.

Configure StringServer so that it handles the mask first. Install it on the desktop as the default application for '*.*', then let it decide what application the file should be sent to. For example, don't have your desktop send '*.txt' files directly to TextView -- let StringServer do its work first.

>Do you mean that you can click on a "mailto:" string and TextView
>will call up Okami (via StringServer), and give you the send email
>dialog? If so, that would be pretty cool.

Yes, if you're in TextView and click on an e-mail address, that address will be passed on to Okami. But StringServer knows it's an e-mail address only because of the string mask '*@*.*'. The precedence string 'mailto:' will be added before the e-mail address and then the whole thing is sent to Okami, which automatically removes the 'mailto:' part. The precedence string 'mailto:' can actually be deleted because Okami doesn't care if it's there or not (it obviously checks).

In a future update I hope we'll see Okami have internal support for StringServer: read a posting and then click on a URL to launch CAB or aFTP. Or shift-click on the URLs to send them to StringServer's log files and visit them later (through TextView or Okami's 'View File').

Yo! Dave of eternal@cam.ac.uk!! I sent this to the address you gave
and it BOUNCED! Please check your e-mail address.

I will attach it here where you may find it:

To: eternal@cam.ac.uk
From: rcain@zetnet.co.uk (Roger Cain)
Organization: Home of 'Arcane' Wisdom
Subject: Re: Dixons free internet service / BT C
X-Mailer: NEWSie Version 0.92 (Atari)

>About the free dixons account, do you get technical info, such as ip
>addresses, dns servers etc, because i use linux and i need this info.

I have managed to connect to this, Dave, after a bit of
experimentation.

You MUST use a secure browser connection to do the first registration
with https://signup.freeserve.net/ . I borrowed a PC with Internet
Explorer to do this although I hear that it can also be done under
MiNT comms. s/w (and, maybe, with Linux). The info you give is the
<x>, <y> parts of your e-mail address <x>@<y>.freeserve.co.uk and your
password <pass>. Your IP is dynamically allocated (via PPP) at each
connection.

It works fine, I have had no BUSY lines and only once has my dialer
timed out because Freeserve took too long to allocate an IP.

Their modems do not understand VFC (I have a Zoltrix 288 which uses
VFC for 28k8 DCE).

I use STiNG but I guess that if I give you the dial-up script you will
be able to extract the bits you need:

A Falcon _can_ be connected to an AppleTalk network : the zilog chip can deal with the protocole if you plug a line-tranfo on the LAN port and if you have the correct software (that puts the zilog in FM mode). ITOS LAN does something like this, but I don't know if it's stricktly AppleTalk-compatible.

You can't do it the same with scsi : you'll have the solder a 50-pin flat cable under the falcon'smother board, at the scsi connector's bottom. It's quite tricky : I did it for my zip drive to fit in place of the floppy disk drive. Works well now, but I had to cut the shield to close my falcon again ;-)
(BTW : A 3"5 drive fits _exactly_ between the power and the floppy)

>
>Rgds, Derryck
>
>/--/
>/ The Cheshunt Computer Club Herts UK /
>/ http://www.cix.co.uk/~derryck/index.htm /
>/--/

Yes it works. I contacted Mario, and he was extremly helpful and checked
it and found software solution.

It is little complicated, actually components from 3 package
are required:
1. Driver from HDDRV751.LZH or from version 7.50 (HDDRIVER.PRG).
2. METADOS.PRG and ISO9660F.DOS from METADS27.ZIP.
3. SPIN_SD.BOS from SPIN034.TOS (SFX archive)

Explanation is in file SPIN.TXT, but this is in German, so I'll give short
help. You must put in AUTO folder first HDDRIVER.PRG - it must be executed
first, then following files (order not important) : METADOS.PRG,
SPIN_SD.BOS, ISO9660F.DOS and create or edit CONFIG.SYS file with following
lines:
*BOS, A:\AUTO\SPIN_SD.BOS, Y:16
; First letter is (of course) boot drive and may be C, Y is physical device
identification and value 16 is for master, for slave goes 17.
*DOS, A:\AUTO\ISO9660F.DOS, E:Y
; E is logical drive letter, put here required letter.

This is well explained in example file CONFIG.SYS in Metados package, only
problem is that included CDARGEN.BOS can't read from Atapi CD-ROM drive.
Metados and Spin034 you may download from following site:
http://www.muenster.de/~reschke/soft_e.html .

Before one week I asked how read from Atapi CD-ROM drive on Atari ST.
Mario Becroft from New Zealand was very helpful and checked it and found
with which software it goes. I explain it shortly, maybe help some people.
Of course this is probably not only one solution.

It is little complicated, actually components from 3 package
are required:
1. Driver from HDDRV751.LZH or from version 7.50 (HDDRIVER.PRG).
2. METADOS.PRG and ISO9660F.DOS from METADS27.ZIP.
3. SPIN_SD.BOS from SPIN034.TOS (SFX archive)

>>So i'm happy to got my last week ;)
>
>:-))
>
>How difficult was it to fit and are there any incompatible programs?
Not difficult at all. I installed mine by myself and did it right the
first time. I did have a prob because my falcon was heavilly modifed.
And my keyboard (had a prob, but didn't show up at 16mhz). so fixing
the keybord made the ct2 to work. This caused my some headaches as I
didn't know why it wouldn't work at first.
The installation is easy and pretty straightforward, however it is a
long task, (I took almost 3 hours). And you need to be very careful
with your soldering iron, utility knife. As long as you have patience,
a little knowledge in soldering and 3 hours to spare, The ct2 is no
problem.

Gizmo users: Your card won't work, When switching in 50mhz mode,
nothing will happen, coz your 14meg of ram are too slow. (I had to
switch back to the atari 4meg card).
I bought 32meg of EDO ram (39 USD brand new), Works like a breeze.
The compatibility is MORE than excellent.
I even tried some old games, falcon games, graphic programs, MiNT,
Some applications are quite impressive I have to say. You will change
the way you use your falcon.
Using a 256 or TC mode won't be a pain anymore. Will be just like
using TTmedium resolution. Papyrus is a dream coming true, CAB is
smooth finally. All the GEM graphic/drawying prog are finally useable,
NO need to waste time and quality with some dithering.
Anyway any questions are welcome..
bye.

I've just got an mo4 MIDI expander for my Falcon. I use Cubase Score and Studio Module. I knew of reported problems with sending long SysEx messages through the mo4 from the Studio Module, but I don't seem to be able to even send patch change info. My set up works fine from the normal MIDI out.

I may have something set wrong, but I can't think what. Or is this a known problem? I very much hope not since I rely on the Studio Module for patch selection.

Suggestions and pointers gratefully received.

Mario has designed a serial mouse to Atari mouse-port translator. I'm one of the UK distributors, over here it'll retail at under 20 UKP, that may seem like a lot but you'll only ever need one and then you'll be able to buy mice pretty much anywhere for ages.....It's quite a neat little thing, you could fit it internally to a desktopper (I'm going to)....

You can add Cranach Studio to the list. Besides the use of scanning,
Cranach also uses GDPS to print PostScript-to-disk and to allow Calamus
printer drivers to be used directly within Cranach itself.

I was curious to know if anyone would be able to tell me how much an Atari 520STfm would go for if I were to sell it. All it has is the 3.5" disk and no H/D. I have the color monitor, mouse, and some software for it.

Could these computers be even remotely close to being collectors items?

Mine doesn't seem to be using GDOS at all, although I have NVDI (an
early version - 2.5 I believe).

There's an option on the first page of the config menu concerning
"externe <CONTROL>P". I have this set for SPOOL - an AUTO folder
print spooler, and "benutzen" is not selected. Don't know if this
makes a difference.

>with PGP? (Pretty Good Privacy)

Depends what you want to do. Okami has the ability to sign, check the
signature, or decrypt a mail.

If you are using Newsie, I've a small program that sits in between it
and an editor. This gives Newsie the ability to sign news as well as
sign and/or encrypt mail. AFAIK there isn't an application that will
verify signatures, or decrypt, news or mail from within Newsie. To do
this you'll need to save the mail/news article and pass it on to PGP
outside/alongside Newsie.

>Otherwise I'm stuck!

Well, Derryck, I had already done the whole of the things you suggest. No appreciable result... but don't feel stuck for such trifles, please: I'll simply keep on saving my PAP documents as IMG files and then import them into Straight-Fax. Furthermore, faxes are becoming more and more unnecessary, as this E-mail message of mine shows...

thanks anyway and kind regards
Marco

In <6vkbvaoip2@plutonium.compulink.co.uk> Derryck Croker wrote:

>How difficult was it to fit and are there any incompatible programs?

Maybee some old programs without fast ram support won't work well.
Hm, in that short time i can't found here anything that won't work.
Texel, papyrus, qed, cab and a lot more works well.

Fitting is middle, but you must know what you doing :)
Some parts are easy, some other a bit harder. Carefull while deaktivate
the old CPU, you have to lift smd pin17 from the mainboard. If you
cut that, you can't remove centurbo.

I need's nearly 3 hours for fitting.

Centurbo needs 12 wires from board to mainboard.
You have to remove your 74Fxx clock patch

If the pads of R216 are empty, you need an 33 ohm resistor to fill that place.

All wires from centurbo connector are easy to solder.
Watch the correct DSP track..
Cutting pin 3+4 from midi+ keyboard acia's are the same as fx or some
other acellerators. Difficult is the handling with two smal black wires
from the centurbo board. That's are the IDE read and IDE write signal.
You have to cut track 23 / 25 of the IDE flatcable..

Also difficult is the space between the ct2 heatsink and the -12vdc
line of the internal PSU !! Devil's details.. ;/
Further than, the original internal 2.5" drive needs a new place :/
(ct2 heatsink is to big)

(Use a saw (sï¿½ge) to cut the metal tray) :(
(What's the right english word for "metalsï¿½ge")

This weekend i made some pictures of my IDE tray-development :->

Dismount the right front screw from the psu, otherways ct2 heatsink
sit on the screw.. ;/

>>It's realy fast. Good development!
>
>It's going to be hard to decide which of these upgrades to buy for my
>Falcon, between Centek and the two Titan products there's a lot going on.

Hm, with all the ;/ points i can say: ct2 is the best, fastest!
I'm not see'n a fast falcon before :)

And there are billions and billons and billions out there. ;}

The thing that made it realy bad, was I had all my main backups
files on it! and in less than a sec it's all gone! You know, I'm
starting to wonder if the effects of my BBS had anything to do
with it? While it's on my TT, the Falcon is close to the event
horzon of the 'Black Hole'! hmmmm ... got to check the keys on
this TT, just noticed that when I hit the ! key sometimes I get a
little es printed next to it.

I do have a question (here we go again!) does anyone use the
sting/newsieprogram on a falcon using a 1224 monitor? I have
tried it, but the lines of text and stuff are sqursched on top of
each other and overlaping. I've tried shifting from true color to
4 color ST med but get the same thing there too.

You can get an Auto program that turns your TT's Serial port into a
driver for a serial mouse. My Atari Mouse went out, so I had no
choice. It works great. It is called GENMOUSE and i am pretty sure it
is available on UNICH.

There is Trackman from Hollis Research free of the net.
There is Sweet 16 lite which is a demo version, but you can still save
your songs. the complete version is only $30.00 however!
There are some good PD from UNICH..Alchemy Jr is a good example.
Just do a net search: Atari Midi Sequencers and stuff will come up.

Yo Dennis,

Well, still having a few problem's, eh? If you have a Falcon, use a SVGA,
dude <g>. I'll send a EZ Drive soon. I ran into a few problems as my
supplier ran out of the SCSI I was going to buy. When I get it, you'll get a
new SCSI EZ Drive which is coooool. No one wnat s to enter a "black hole"
these days. Ahhhhh, maybe just the Republicans <hehehe>.

So StringServer knows what to do with the file based on the key
combination used when it was clicked on the desktop.

For instance, I have StringServer configured so that if I click on a
JPEG, Photoline will load it; shift-click, GrafTool; alternate-click,
JPEGTRAN.TTP (including a predefined command line).

But the last part isn't working for me yet: JPEGTRAN.TTP is launched but
it's having trouble with my command line (other TTPs, too). Somehow the
input filename isn't being passed on correctly. I'm stumped as to why.

599. File Handels ?

Newsgroup: comp.sys.atari.st
Date: 1998-10-10 00:00:00 UTC
From: Brent Thirsk <thirsk@telusplanet.net>
Message-ID: <361F4D38.155C@telusplanet.net>
Source record: 92159

I am running Mint 1.14.7 with mintos on a TT030 with 4 attached
terminals.
When running several instances of the same application, are file
handles for disk files the same over the system regardless of which
application is opening a file.
eg: If each process uses file # 48 for a particlular file, and one
tries to access the file while it is already opened by the other
process, does the system handle this file as the same for both
processes, namely reporting the file is already opened, or as seperate
occurances.
As I have mulitple iterations of the same process on terminals, these
processes of course treat files in exactly the same manner.
Also when a file is opened, is time sharing stopped until the file is
closed.
I occasionally have a program quit when 2 terminals try to access the
same file a the same time.
This problem only occurs on rare occasions, about 4 times in over 1000
hours of running.
Any suggestions that will help clarify this would be appreciated.

You are making sure that there's a trailing space in the "precede" field?
Like, if the command line is "-d -x -c", it looks like this, where the
"*" is the EOL char;

-d -x -c *

and not

-d -x -c*

So the correct commandline created by the StringServer looks like;

-d -x -c c:/file.jpg

and not

-d -x -cc:/file.jpg

You can tell by the EOL char (the carrige return) that you indeed have a
space at the end. If not, the file will be added directly after -c and it
will not work.

Hope this helps

I just found a very bizzare program for the ST at the local Goodwill.
Its basically some kind of fibre optic cable attached to a cartridge that
inserts into the ST cartridge port. The other end is taped (!) to the printer
head that scans images feed into the printer.

Just curious to know if anyone on this newsgroup has used this particular
utility. The program disk apparently saves the scans into some type of
standard graphics file format. I only use my ST for MIDI sequencing so I
don't know much about it. Can anyone recommend some good Graphics program
that can read and manipulate these files? Also if anyone has used this thing,
can you recommend a cheap printer that is compatable with it?

thanks in advance

I've heard about this problem too, but I don't have the studio module, so I've never tested it myself. I believe you can send sysex with the MO-4 - but not with the studio module. I may be wrong so ask SoundPool to make sure where the problem lies info@soundpool.de or visit their home page www.soundpool.de - there is a FAQ among other useful pages...

Hi Lewis,

obviously you're running from MagiC. Several people in here running MagiC and Newsie w/o any troubles (including me), so something in your config must be wrong. Exactly where does the shit happen?

Looking at the msg (plus the previous test msgs) you managed to run it, including the text editor.

Can you tell us what's in your autofolder and the major items in your system? Installed Sting as last one in the auto? Got the HS-modem stuff there? Set up Newsie correct? Perhaps corrupt files somewhere <VBG>??? What's the editor? etc.etc.etc...

Hello, I have recentally purchased my first TT030/8 and I have three questions that I was wondering if anyone could help me out on.

1: My TT030/8 came with a 720k drive. What do I need to do to put a 1.44 in it?

2: What do the dip switches do? Where can I find out?

3: When I first turn the computer on, it will not boot until I hit F5, why is that?

Thanks,
John

Throw the jaz drive out.
I have had 4 of them, 4 of them broke.
Iomega have that many problems with their jaz drive, they stoped this
product.
It would work for like 4 months fine. but then break internally. Not
reliable at all. The ZIP is much more reliable.
So basically the JAZ dream is not happening, for this simple reason.
Just get a standard harddrive. and if you need a removeable I would
say a zip or try some of the syquest 1.gig too. Might have better
chance.

The TT030/8 means it had 4 megs TT ram and 4megs ST ram. The best thing to do would to upgrade the TOS from 3.01 to 3.06 then depending on the chip that controls the drive you may be able to stick in a 1.44. Dont remember what the dips do. When booting its looking for the hard drive that is not in the TT you should be able to get away with sticken in a floppy to boot faster. And you should be able to hit any key to get it to boot right away.

Don

Glad to see it made it okay!!!!

Yes, the trailing space is part of my command line.

When I used to run NeoDesk I had predefined command lines using that
desktop's NPI feature. For instance, to create a smaller JPEG, I used:

-optimize $$ j:\smaller.jpg

But somehow when I pass this command line (and variations thereof) using
StringServer, the inputfile isn't read correctly.

The TTP's docs say this:

usage: jpegtran [switches] inputfile outputfile

Applier uses '~' to represent the inputfile. What does StringServer
expect to be there? Note that I'm running Magxdesk along with Alexander
Barton's AV-Server.

I admit to being a command line dummy, one of the reasons I've relied on
having them predefined ;-)

625. The 9th Adventurers Convention (UK)

Newsgroup: comp.sys.atari.st
Date: 1998-10-10 00:00:00 UTC
From: Larry Horsfield <Alaric@larryhorsfield.demon.co.uk>
Message-ID: <HlAxypAZx7H2EwKo@larryhorsfield.demon.co.uk>
Source record: 92185

Any adventure fans in this NG, please read on:

This is the final reminder about the 9th Adventurers Convention, being held in Birmingham (UK) in two weeks time.

The event is being held on Saturday, 24th October, in the Ariel Suite of the Royal Angus Thistle Hotel, St. Chad`s, Birmingham B4, which at the end of the A38M and easy to get to from all parts of the country. It runs from 9am to around 6pm and covers all formats from Spectrums to PC`s. Tables are available if you wish to bring along your own computer(s) and we actively encourage this as we depend on those attending to bring their computers, so the more the merrier! If you wish to bring hardware and/or software to sell you are more than welcome to, but no pirated software please!

The event attracts adventure enthusiasts from all over the UK, including Northern Ireland, and the atmosphere is very friendly and informal. Many of us stay overnight at the hotel and the evenings can be just as lively and interesting as the convention itself! We have yet to welcome anyone from outside the UK, but we live hope!

During the day we have the popular "Megapoints" competition running. In this the contestants get 20 minutes playing time at a specially written Spectrum text adventure, with the object of scoring as many points as possible in the alloted time. There are usually cash prizes and special certificates for the 3 highest scores. The adventure this year has been written by Ulsterman Jon Scott, author of various Spectrum text adventures published by Zenobi Software.

Tickets are available at 6 ukp per person from the address below, or you may pay at the door on the day if you wish.

Vicky Jackson, 128 Merton Hall Road, Wimbledon, London, SW19 3PZ

Please make cheques/PO`s payable to V. Jackson

* * * * * * * *

HOTEL ACCOMMODATION:

The Royal Angus Thistle Hotel has special room rates for those attending the Convention. These include full English breakfast and are as follows:

Single Room: 37.50 ukp per night.

Double/Twin: 32.50 per person, per night.

Please contact the hotel to book your accommodation, NOT the convention organisers. The address and phone number are:

Royal Angus Thistle Hotel, St.Chad`s, Queensway, Birmingham, B4 6HY

Telephone: 0121-236-4211

Don`t forget to inform the hotel you are attending the Adventurers Convention, otherwise you will be charged the normal room rates!

If you have any queries about the Convention, or would like to reserve tables for your hard/software, please contact me at the email address below.

Hope to see you in Brum on the 24th!

Larry Horsfield

Oh... this is a feature that the StringServer doesn't have yet. It always puts the inputfile at the very end of what's in the "precede" field. This might be the problem if the .ttp expects the input file somewhere before the switches. This will, ofcourse, be dealt with in later versions. I don't konw anything about Alexander Barton's AV-Server, but I really doubt it has got anyting to do with your problems. Could you mail me a detailed description of what you are trying to do, with what programs? That'll make it easier for me to deal with the problem :)

>JPEGTRAN.TTP (including a predefined command line).

I see what you're saying. I wasn't thinking of trying different key
combos (at least for text files), but I might.

Are you still using Applier, or has StringServer completely replaced
it?

: want a higher quality mouse. One thing Microsoft does perfectly: mice and
: keyboards.

: Stephen Cavender
: Surf on a PC; create on a TT

Well then you could use the Mario Becroft Mouse adapter which plugs into
the Atari mouse port and interfaces to the two main types of PC Mice. I
really like it and it has double click and left-click-and-hold. Also,
I am using the Mario Becroft PC Keyboard/Mouse Adapter on my TT030 40MB
RAM and it is also to be commended. I have tried it with various
trackballs and mice and touch mice, the glidepont is nice to use:-)
No other software needed and you don't use up your serial ports.

I know this NG is for the ST/Falcon, etc... but I couldn't find an ng for the 800xl, so here it goes. I got an 800xl and 1050 disk drive the other day for $5 beans, good deal. Well, the kicker is that there were NO cables for it, and frankly, I don't think I'll ever find any in the wild. So, that's where the good ol' ng comes in. I need all the cables for both these units. If you think you can help me, by all means do. 8*) Thanks.

Hi,

I have the following software for sale:

1, Ultima I (1986 remake edition)(for 256k IBM PC/Tandy)
Complete with five coin of realm, a 5.25" disk, Player reference card,
manual and 4 cardboard map. (all in near mint condition)

2, Ultima II (small grey box edition, for Atart ST computers)
Complete with 3.5" disk, 21 page manual and cloth map (also near mint
condition)

3, Ultima III (for IBM PC/PC jr/Tandy)
Complete with Player reference card, 1 5.25" disk, the book of amber
runes, the ancient liturgy of truth, the book of play, a large cloth
map and "Secrets of Sosaria" paper advertisment. (all near mint
condition)

If anyone interested, please give me a offer, thanks.

Regards,
Samson Lam

I'm using the five TTPs of The Independent JPEG Group's software. But the problem was at my end, namely not reading the docs of the JPEG software correctly. I somehow missed a switch allowing the output file to be named first instead of last:

-optimize -outfile j:\smaller.jpg

My predefined command lines in StringServer are working great now.

There's no need for Applier now, Terry. While you're at it, you can get
rid of XURL, too. Both are great programs but, in my opinion,
StringServer and TextView replace them.

It sounds like an IMG-Scan image scanner, sold in the UK by Ladbroke Computing in 1987. I experimented with it, to the extent of making a carrier for the fibre-optic tip from a cut-down ballpoint pen and a piece of alloy, since it is important to position the tip accurately over the scanned paper. It will save scanned data in Neochrome or Degas format. Vertical scanning pitch is whatever the minimum vertical movement of your printer is (e.g. 1/216" for an early Epson dot-matrix, or compatible- I used a PW 1080A), and horizontal is selectable by software. It works by sending a line of 80 space characters and a full-stop to the printer (the full-stop is necessary because some printers ignore trailing spaces) then scanning the image as the print head traverses it. Since there is no feedback from the printer as to where the head is, scanning is done purely by dead reckoning, which means that any variation in the speed at which the head moves will cause distortion of the image, which gets worse the further across the page. I tried delimiting images with solid black lines at left and right edges, and writing software which would 'line up' successive scanned lines by interpolation, but overall the results were not impressive. In addition, it was S-L-O-W.

Flatbed scanners are fairly cheap these days- consult Homa to find out which have Atari-compatible software- so if you want to do any serious scanning, I would go that route and bin the IMG-Scan. Alternatively, you can sometimes pick up a Daatascan hand-held scanner second-hand, which produces good monochrome results for images up to 105mm. wide- that plugs into the cartridge port too.

Hope that helps.

Hi Mario,
How fast is the ST-Memory rated? If it is on the slow side is it not possible
that the CaTTamaran is pushing it too fast hence the random problemns during
intensive access? Have you thuoght aabout rebuilding one of the ST-Ram boards
with some fast (ie 70ns or better) memory. Even if the boards are built using
41256's then it shouldn't be too much of a bind to convert them to SIMM's It's a
shame this didn't come up earlier, I have some 70nS 256K SIMM's kicking around
somewhere I could ahve sent yu with those EPROM's...

Heeeeej, Ronald

We kunnen beter Nederlands praten.
Ja ik heb inderdaad ook dezelfde van de firma.
Jullie hebben een zeer interesant blad!!!
Wij gaan vaak naar de STACC club in Bemmel.
Binnenkort ga ik mijn homepage op internet zetten.
We zitten op internet met een 1040 ste WOW!!!

Now for English people.

Heeeeej, Ronald

We can better talk Dutch.
Yes, indead I have the same driver.
You have got a very intresting paper!!!!!
We go to the STACC club in Bemmel.
Some day I will update my own homepage on the web!!
We are on the internet with a 1040 ste WOW!!!

>

I'd have to disagree with this quite strongly. As an owner
of both a Amiga 1200 and Falcon its obvious to me that the
Falcon is a lot faster than a stock Amiga 1200. Remember the
Amiga 1200 is only 1.25 mips unless you add fast memory to
an expansion board that fits underneath. The Falcon is 3.84
mips. Frontier runs a lot faster on the Falcon. I can say
quite honestly that I was well impressed with the speed
increase of the Falcon over a normal ST and very
disappointed with the speed increase of the Amiga 1200 over
a 500/600 model. Mind you I soon upgraded the Amiga 1200
with a 68030 board at 40MHZ so its now a fair bit faster
than the Falcon. In fact from memory I remember doing some
benchmarks and the Amiga is now 6x faster than its original
speed. Chip memory remains controlled by the 68020 at 14MHZ
DOH!

Hi, fellow TT users,

I was just wondering: does the bus speed up too, or is it just another
clockspeed increase for the 030? I recall having used an accelerator on my
old ST once, speeding the clock to 16 MHZ, but the bus in fact remained at
8.
We've been experimenting screwing up the bus speed on a STe, where around
10-11 MHz was the bloody limit. This was with the CPU already running at
36 MHz... Faster bus speeds lead to problems.

BTW: I ordered one of the new Aixit boards from Germany, it looks like the
whole production batch is sold already... :-) The guy did tell me there's
another one following later, but last friday they had 13 left in stock...
A whole bunch was sent off to the US, so people out there, check with Best
or other dealers... these things are becoming scarse already!

661. Help with PacificST

Newsgroup: comp.sys.atari.st
Date: 1998-10-11 00:00:00 UTC
From: sanskrit <sanskrit@usa.net>
Message-ID: <362090EF.3013F0C4@usa.net>
Source record: 92121

Hi,

Just downloaded Pacific ST and TOS Roms. Tried installing it on a
Pentium 200 MMX
system with both PC-DOS and Windows 95.

I get the start up screen, and get the GEM desktop. But I haven't been
able to
figure out how to get the program to recognize by hard drive (1
partition drive C, 1 gig).
Do I have to create a smaller partition and format it in a special way ?
The
program does create a floppy drive A on my hard drive (which shows up as
a blank
floppy). And I haven't converted anything to .ST format yet.

P.S. I was wondering how much better/worse is gemulator ?

Thanks.

: Cattamaran only works when there is 2 Mb in the TT.
: I was surprized. As you are.

I am currently using a CaTTamaran with 4MB of ST RAM on a TT030 Rev. H
motherboard.

Note it was installed by a professional technician and is soldered to the
add on 2MB ST RAM board. It has work flawlessly since 1996.

Two of the CaTT's installation wires have varying installment options which
allow you to deal with variances in the TT030 boards.

We need to know more as this sort of error can come from anywhere.
What provokes it?

Have you done the installation properly? Have you completed the
Preferences section? Have you read the manual?

I guess Newsie is trying to handle a resource (store, file, .RSC item)
which it cannot find.

Louis - it just increases the clock speed of the 030. I tried to
install a CATT inmy TT along time ago. Never could get it to work reliably.
When it did work there was a noticeable increase in speed, esp. when working with
vector graphics in Calamus (32 to 48 MHz is a 50% increase). The problem
seemed to be timing with the 16 megs of TT ram. After pulling out the
CATT I started having stability problems with the TT and then boot
problems. Discovered that there was a hair line crack on one of the
connecting pin solder joints in the TT ram board. Re-soldered and the
machine as been dead stable ever since. I never have gotten around to
try and install the CATT again :).

Regards,

Steve Hammond

A-hem! Found it, tried it, chucked it: I can't get it to do anything
on my TT except show messages. That's why I had not used it before.
I have deleted it and will stick to ImageCopy.

Charles.

: Louis - it just increases the clock speed of the 030. I tried to
: install a CATT inmy TT along time ago. Never could get it to work reliably.
: When it did work there was a noticeable increase in speed, esp. when working with
: vector graphics in Calamus (32 to 48 MHz is a 50% increase). The problem
: seemed to be timing with the 16 megs of TT ram. After pulling out the
: CATT I started having stability problems with the TT and then boot
: problems. Discovered that there was a hair line crack on one of the
: connecting pin solder joints in the TT ram board. Re-soldered and the
: machine as been dead stable ever since. I never have gotten around to
: try and install the CATT again :).

: Regards,

Steve,

A few years after having my CaTTamaram professionally install. I
increased my TT RAM from 4MB to 16MB. It work flawlessly with the
increased RAM.

TT RAM chips must be 30 pin 1Mb or 4Mb x 8 non-parity nybble mode SIMMs.
^^^^^^^^^^^^^^^^^^^
The 8 means 8 chips on each memory card, NOT 9 or 3, they will not work.
I purchased my chips through Memory Supersource 1-800-457-6837.
Item # WM4000870S 4MX8 70NS SIMMS

There does seem to be a loading order of the CaTT drivers for smooth
operation. I had printing problems with both the Atari SLM-605 and HP 660C
until found the correct order.

I don't run the CaTT driver in TT RAM.

AUTO Folder PRGs in loading order

Loading options codes

F Fastload

Last Monday I recived a IDE drive to go into my Falcon030.

I put it in and everything was working fine. So I buttoned up
the machine and sit it aside.

Last night I figured I'id start re-setting up the programs I
used on it. BUT, now the monitor does not come on, the drive does
not spin up . If I unplug the IDE drive, the computer goes and
boots ok.

Could this be caused by a broken wire in the ide ribbon cable?
I've looked at everything else, and the only other thing I see is
a broken switch that goes to the muffen fan inside the case. I
don't think it would have anything to do with it.

Just trying to float some ideas as to what could have happened.

Oh with the ide drive, there is a very faint click/snapping sound
from near or in the power supply.

Well, what ever went bad, it's taken everything with it. Now after I've put it back together(but for the top)when I power up the Falcon, there's nothing from the monitor, nor does it access the floppy drive. After 4years of working for me, it's taken the big dive and works no more.

So now I'll most likly just pack it up and store it away until I can save up enough moneyto sendit someplace for repair, and that's going to take an awefull long time. So no more color for me, I'm now stuck with the TT and it's mono monitor.

>Nothing happens when I double-click on them. Any ideas?

I don't have Ease installed right now, but it sounds like you need to configure Ease's Application dialog so that certain extensions are disabled (like prg, app, ttp, acc). Because the mask '*.*' is all-encompassing, Ease is passing the executable file itself on to StringServer, something that shouldn't happen. StringServer won't do anything with masks that don't meet its criteria (i.e. executables aren't even defined because they're not intended to be processed).

687. CaTTamaran problems in TT

Newsgroup: comp.sys.atari.st
Date: 1998-10-11 00:00:00 UTC
From: mb@tos.pl.net
Message-ID: <Q7F3CSF@tos.pl.net>
Source record: 92193

Some time ago I obtained a CaTTamaran for the TT, but I never did get it working properly, so I soon removed it.

I decided to look at it again, and this time I've discovered some perhaps more useful information about the problem.

I installed the board in my Rev. H TT according to the directions provided with the Rev. B CaTTamaran. Since I have a 2 MB ST RAM board in the TT, I plugged the CaTTamaran into the pins on this board as explained in the directions.

First the ST RAM would test ok (and the test ran MUCH faster) but when it came to TT RAM it would crash or test bad. After changing one of the jumpers on the AixTT RAM board, this problem went away, and TT RAM tested ok. But while trying to use the computer with the CaTTamaran installed, I noticed the same problems that I always had; that is that the machine crashes at random, and that while dragging windows around or accessing the drop down menus (that is, all times when the image is being copied around the screen) odd lines of 16 pixels across and 1 pixel thick appear in the display.

After removing the ST RAM board and fitting the CaTTamaran directly into the ST RAM socket (via a strip of pins that joins the CaTTamaran to the socket) the board now works fine. At 48 MHz, the TT doesn't crash and there is no corruption visible in the display.

It would appear that while the ST RAM board is installed, the ST RAM is not reliable. There is odd corruption, leading to the crashes, and visible on the screen when copying the images from one portion of the screen to another (which is intensively accessing the ST RAM).

I did try three 2 MB ST RAM boards, two being similar in appearance, the other being of a different design, but they all failed in precisely the same way when the CaTTamaran was installed. I also tried adding some SIL sockets onto the ST RAM board pins where the CaTTamaran connects, and pushing these SIL sockets each very firmly onto the pins (thus obtaining a much more solid connection than could be achieved by plugging the CaTTamaran directly onto the pins) but this made absolutely no difference to the faults.

As I have tried three different ST RAM boards, having removed and re-installed the CaTTamaran many times, and also used additional SIL sockets to obtain a better connection, all with precisely the same results, it appears to me that the problem is unlikely to be caused by a bad connection onto the CaTTamaran, although in the past this is what everyone put the problem down to. I would prefer not to solder the

CaTTamaran onto the ST RAM board, as this would involve removing the sockets from the CaTTamaran board, which would be tricky, and then adding the board to the ST RAM board, only to remove it again if it does not work any better (all adding to the possibility of damaging the CaTTamaran board). Therefore I would be very interested if you could confirm with certainty that a bad connection is very likely to cause this problem, or on the other hand, very likely not to do so.

The CaTTamaran documentation refers to some alternative connections to use when the CaTTamaran does not work well on a revision H TT. However, although it does not say so exactly, it is implied that these changes are only useful in the event that the FPU fails, which is not the problem that I am observing. Is there anything else I should try in order to solve this problem? For although the CaTTamaran provides only a modest increase in speed, every small piece still makes some difference, and so I would like to be able make the CaTTamaran work well.

Any suggestions that you might have would be appreciated.

Whoops - thanks to you, Kevin and Mario.

Simply, I didn't see the first partition icon that Thing had added, not at
the end of those already present but tucked away amongst those already
present. Basically because I'd expanded the res. which left a nice handy
icon space where previously there had been a screen border! <blush>

Yes you can use STinG with CAB - in addition you will also be able to use
all the other clients (such as NEWSie, aFTP and a multitude of others) that
you can't use with IConnect AKA PPPConnect.

You must use another CAB.OVL tho' - if you can get internet access then go
to http://www.netset.com/~baldrick/ovl.html and grab the latest version.

In case the interface is fully Atari compatible you can install HDDRIVER
like it is supposed to be installed, i. e. not in the AUTO folder but
according to the installation instructions.
Note that HDDRIVER is commercial software. It must not be distributed in
files like hddr751.lzh or hddriver.prg etc.

Well, there are a few freeware/shareware sequencers, but you sound
serious enough about it to justify spending a bit of money on a 2nd hand
copy of Cubase or Notator. I have never found a freeware sequencer that
offers as much as these do. The closest to it would be Sweet16 or
Sweet16 light from:

http://home1.swipnet.se/~w-11396/download.htm

Good luck

They probably never will be. They made millions of them. It was the most
popular computer in Europe around 1987.

Now, a 130ST running disk TOS on the other hand...

That's an ordinary (boring) 8086 PC, not an ST.

I suppose it needs an IDE controller card to use a hard drive. Most old
PCs were like that.

It could be a power supply problem. Is it a 3.5" drive ? The Falcon's
PSU is strong enough to power a floppy and a 2.5" IDE, but those 3.5"
buggers are greedier.

Try unplugging the floppy's power cable to see what happens.

You might need to get an extra PSU.

Try RTFM, then edit "mountdrive" line, or whatever it is, in the
pacifist.ini file to reflect the path of your Atari directory. Don't
forget to use 8+3 file/folder names, as it's a DOS program.

CAB and PPP Connect require some sort of preemptive multitasking
environment like MagiC.

If you choose to use STinG, you need to get a new CAB.OVL from:
http://www.netset.com/~baldrick/ovl.html

Yo Dennis,

looks like your PSU gave up... nothing weird on Atari when demanding 5 mA more than normal... Do yourself a favour, go out and buy an empty tower housing for a PeeCee, these usually come with a PSU fitted (200 Watts or so) and use that one for feeding. (Or get a PC PSU if you can get it cheap). It's a matter of connecting the 5 and 12 Volt lines to the plug where the board gets it.

Atari PSU's are terrible: after some years all the capacitors have gone down, and usually they're designed only for the standard machine: it eats say 500 mA 5 Volts and 1.5 A 12 Volts, so that's what the PSU can deliver. Adding another drive and bang!, it's gone.

I'm getting my TT-RAM expansion board this week and am holding my breath on fitting it with 64 Megs. Fair chances the PSU won't take it, since it has to feed my GFX card too already :-)

Will, I've checked the 2nd had shops in the A.V. area, and so
far I've not found one monitor that has the same pin out as the
one I'm using on the TT. I did find a monitor in the trailer
parks dumpster and it plugs in ok,but it's broke too, only get a
thin line across the middle,(no Vert.) and right now I can't
afford anything, heck, I've got a whole $16.75 for the rest of
this month. I live off of VA Disabilty and SDI disabilty.

That's why it's going to take some months before I can even think
about having someone look at the Falcon for repair.

707. Timing and MIDI and MiNT?

Newsgroup: comp.sys.atari.st
Date: 1998-10-12 00:00:00 UTC
From: Anders G{rder <f93anga@dd.chalmers.se>
Message-ID: <6vsovo$6q2$1@eol.dd.chalmers.se>
Source record: 92062

Hello,

I've written a program for SingleTos that steals the keyboard/midi interrupt and uses timer A for timing. To my surprise it all worked under Mint 1.15 with AES 4.1 too!

So now I am curious. Can I make this program compatible with MiNT!?

Can you freely use Timer A under MiNT?

To make the keyboard and mouse work my MIDI rout also calls the address stored in $1156, is this an official address?? Will N Aes fetch its rout there, too?

If this all is allowed, one could easily (oh well) write MultiTos sequencers and such stuff...

Sorry to those who have been waiting for the update to my FAQ.

My TT is currently down, thanks to a defective AixTT card, so all
the new stuff I had planned on uploading is just sitting there on
my hard disk, uncompleted...

Also, I am currently without a home internet connection, because
the finnish phone company requests a hefty safety deposit from a
foreigner - for which I will have to save up - so everything has
to be telneted from my workplace, during breaks...

Hopefully, things will be back to normal pretty soon....

If you have any comments about my Stacy and TT030 FAQs content,
or ideas about topics I should cover, please let me know.

PS: you can still check out the older version of the TT section
on my previous site at http://www.megacom.net/~q-funk/TT030/
until the new one is completed and uploaded.

It seems that FTL games are Falcon friendly. Oids runs on my
Falcon without any problems. You don't even have to set the boot
resolution to ST-Low, although the FLT logo screen looks a bit odd
if you don't.

Sorry to hear that. From what you aid in your previous message I guess
the power supply has gone down. Maybe the IDE caused overload.

Perhaps someone will offer you a spare PSU, Dennis.

Uh-oh! That may indicate that the drive draws too much current and the Falcon's power supply can't start because of that. Get an external PSU for the harddisk.

Good luck!

I've used a 286 based one and I'm sure it was RLL or MFM.

>somewhere in the "no way" to "very unlikely" region.

It's definitely possible at least with an Internal SCSI Zipdrive. A friend
of mine just do this on his Mega STf.
The main HD doesn't work anymore so he is forced to boot from the Zip
which is connected to his Mega STf by means of a Link 97 SCSI converter.
You don't have to have a bootdisk into the floppydrive.
AFAIK all you've to do is making sure that the Zip has SCSI ID 0.
I don't know if it's possible with an external Zipdrive however. With
older Zipdrive one can only use SCSI 5 or 6. If I recall me well, correct
me if I'm wrong, one can only boot from HD which has ID 0.

Hope this help

If the drive won't spin up, it's likely the drive itself.

The symptom when a cartridge fails is that the drive spins up, but when the heads try to seek they can't locate track 0 and so keep "whining" or chattering.

I do have all the proper extenders defined in Ease's "Executables"
dialog, but apparently it ignores that if you have a wildcard defined
in the "Applications" dialog. There is no way to disable extensions
in the Applications dialog.

Apparently, this is not an option in Ease, and I'll just have to
individually define all masks I want sent to StringServer.

Well, it's an option in Ease 4. Either you're doing something wrong or
there was a major change in Ease 5.

Remember that Ease's list is read sequentially, so you must be sure to
have the executable extenders defined _first_ and they must be disabled
('disable extensions'). The mask '*.*' pointing to strngsrv.prg should
appear last in the list. This way when you double-click on a file, the
list is read from top to bottom, so executables will be launched before
strngsrv.prg's '*.*' mask is encountered.

737. Falcon 1.44mb Drive Problem!

Newsgroup: comp.sys.atari.st
Date: 1998-10-12 00:00:00 UTC
From: Tony Cianfaglione <ab616@chebucto.ns.ca>
Message-ID: <Pine.GSO.3.95.iB1.0.981012233416.12740A-100000@halifax.chebucto.ns.ca>
Source record: 92092

I attempted to copy the contents of an 800k floppy to a 1.44mb floppy on a Falcon. Since they report a size mismatch by direct copying, I decided to add a step in the middle by simply the contents of the 800k to a folder and then transfer it the rest of the way to the high density floppy by the following steps:

a) copy the 800k contents to a folder on the Falcon desktop

b) format a 1.44mb PC floppy to 1.46mb Atari Falcon format

c) copy the contents of the folder to the newly formatted floppy

After only 300k has transferred the Falcon reports:

Destination disk does not have space to continue copying. Attempting the identical transfer to an unformatted PC 1.44mb floppy renders the same report.

An info check reveals at least 111,000k remaining on the disk yet the Falcon refuses to continue copying, saying that there isn't enough room.

Anyone have any ideas as to what's happening here? Is the Falcon senile?

Thanks...

741. What's making CAB freeze?

Newsgroup: comp.sys.atari.st
Date: 1998-10-13 00:00:00 UTC
From: nameerf@flash.net
Message-ID: <7007b2$142$1@excalibur.flash.net>
Source record: 91945

Hello all (especially CAB/STiNG/CAB.OVL people),

I remember this being talked about quite a while ago, but not really resolved. Every once in a while (but still way too often) when I'm going to a URL, CAB will get stuck at "Connecting to Host...". The little clock indicator next to it moves every 30 seconds or so, but no matter what, I can't get it to stop. I can't access my Task Manager (using Geneva) to terminate the program, and frankly I wish I didn't even have to do that. Is this a problem with STiNG, CAB, or CAB.OVL? If it's a STiNG or CAB.OVL problem, I suggest strongly that an update be made which constantly checks whether CAB's Stop button or the Esc key has been pressed during this "Connecting" part. If it's a CAB problem, then make the Stop button work during this time.

If this has indeed been resolved before, could someone please let me know? Otherwise, let's work together to make this stuff work the way it's supposed to! On certain sites, the same connection problem occurs with the PC's at the University. The difference is, you can stop those, but not CAB. Will this be taken care of soon? Thanks!

I once had my Expose connected to my Mighty Sonic Falcon with cables
as you question. The cables were about 20" long and all worked well.
The NOVA adapter is intended to be used in this manner and it to works
well. Before recaseing the Falcon, I used the Mighty Sonic in this
manner too without problem. Probably the ultimate test of stability.

I have had three devices, not including the Mighty Sonic accelerator,
fitted to the expansion port. ScreenEye at the bottom, Falcon Speed in
the middle and a NOVA/adapter on top. All work just fine. The only
conflict I could see is if both the Expose and ScreenEye were fitted
at the same time. Apex may have problems with the configuration, but I
haven't tested this yet. It is necessary on most cards to extend the
thru-pin on top by adding your own headder.
The Falcon handles this setup just fine with the Mighty Sonic or
Afterburner (except the Falcon Speed software is not 040 compatible).

Better than plug and pray:).

Hi Dennis,

It sounds as if the broken switch is shorting the powersupply to ground somewhere. What is the fan doing near the joystick ports? What is it cooling? Is there aftermarket hardware installed?

If the IDE cable is not properly installed, the Falcon will not boot, and if left running could damage the Falcon.

The drive is a 2.5" 80meg Conner and the standard P/S will have no problem powering it.

Did you remove the jumper on the expansion bus? The Falcon will not work unless this is installed and installed properly (unless you have another device installed in the expansion slot).

Alexander Barton's AV-Server (#_ENV AVSERVER=AVSERVER) adds the following
functions that Magxdesk v3.23 doesn't support:

AV_ACCWINDOPEN/AV_ACCWINDCLOSED
AV_STATUS/AV_GETSTATUS
AV_EXIT
AV_STARTED
AV_COPYFILE/VA_FILECOPIED
AV_DELFILE/VA_FILEDELETED
AV_VIEW/VA_VIEWED

But that TOS is from 27 August, and my TOS is from 5 September.
Still my fast ports don't work. I can choose them via the cpx yes,
but when I have set a speed higher then 19200 bps, Sting connects
with 9600 bps.

This is really great. I knew it was being developed (I could order it
with my Milan already) Didn't know it was ready. How does it sound?
What programs does it work with and which not?
Actually my point was that a card like this should be part of the
standard Milan. Just like the grafics card.

Anyway, it does run perfect most of the time on my system. As this is
not a program you would use on a regular basis I think it is possible
to live with :-)

But, as my code does not do anything special at all, there might be a
problem with the Face Value engine itself. If you can reproduce the
hanging I can send you a very simple Face Value "written" program to
verify this.

Which speed did you set in Sting? I haven't used Sting, but if you can
set the port speed in it, use 150 bps for 115200 bps, 134 bps for 57500
bps and 110 bps for 38400 bps.

Ciao

From: phantomm@kih.net
Message-ID: <6vu94e$cu3$2@dbtsvr2.dbtech.net>
Source record: 91995

I have a technical question on the Falcon for the Hardware experts.

Can one connect a 30pin and a 50pin ribbon cable to the Falcons internal expansion port. Run these 2 cables outside of the Falcons case and connect 2 or more aftermarket cards, such as a FalconSpeed, Expose and etc. to these cables?

I am aware that some Falcon aftermarket cards have a pass-thru that allows another card to be connected. And would like to connect 2 or more cards, that don't have a pass-thru at the same time to my Falcon. And be able to use them as needed without problems. Is it as simple as using 2 ribbon cables?

phantomm@kih.net

* Word Writer ST on a Atari Falcon *

This is one of my favorite word processors on the ST series of machines. And would like to know if anyone else has any problems running it on the Falcon.

Currently I have either version 2.01 or 2.00 of the software. The disk labels say 2.01. The About dialog says 2.00. Anyway it seems to work on my Falcon except for the Dictionary and Spell Checkers. Selecting either one will produce 2 bombs and the program exits back to the desktop.

I have tried plain Tos 4.04 and latest releases of Geneva\NeoDesk with Word Writer ST with the same results. (Crashing when the Dictionary or Spell Checkers are used). The Thesaurus works however.

Anyone know of a different version that works completely?
Or a way to get this version working with the dictionary and spell checkers?

All,

As the new owner of Diamond Back, I'm happy to announce that there will be a new version. I'm still in the learning and experimentation stage, so there's still a ways yet to go (sorry, I'm not going to give any dates). As for new features for Diamond Back 4, here's what I've got planned (not set in stone):

- Support of Minix and VFAT file systems
- Re-structuring the tape backup to make it more robust (I've lost too many log files to version 3.5)
- Support of Tar-format tapes
- (Maybe) CD ROM support

I know this list isn't large, but remember I'm in the learning stages. And the Minix/VFAT stuff will require quite a bit of work (a lot of the current code has the 8+3 stuff ingrained).

The look and feel will remain the same, except as needed to expand functionality or fix bugs. What I'd like from current owners of Diamond Back is:

- Any bugs you've seen (please include your system info, the backup method used, how you've got Diamond Back's options set, your version, etc...)
- Any new features that -won't- require a large re-work of Diamond Back (another file system = maybe, if it's close to Minix or VFAT; working with a PC's tape drive under MagicPC = I kind of doubt it)

And yes, I do plan on keeping it a commercial product.

Note that I am also the new owner of Diamond Edge, but, I thought it would be prudent to have a way to restore a file system -before- I start experimenting with optimizing and repairing it. Hence the new version of Diamond Edge will have to wait. But, if there's sufficient interest, I can release the current version (with any current bugs it may or may not have). I just won't be able to provide and "real" support.

If you have any questions or comments, feel free to email me.

Thank you,

Michael White (michael@fastlane.net)

: more cards, that don't have a pass-thru at the same time to my Falcon.
: And be able to use them as needed without problems. Is it as simple
: as using 2 ribbon cables?

There are two issues here, one is whether the machine will work with the long ribbon cable attached, the other is whether the two cards will co-exist when you put them both on at once.

With a long ribbon cable attached to the Falcon's expansion port, you may find that it affects the reliability of the machine, since the signals on the expansion port are, I believe, connected directly to the processor signals. You would just have to try it out and see whether you have any luck.

However even if you get the ribbon cable working, I doubt that you could simply plug two cards in. Apart from the obvious problems such as a possible conflict with the address space used by the cards, there will likely be some other issues. I think there's some sort daisy-chain scheme with the bus arbitration which may have to be accounted for, for example. Apart from that it looks pretty straight forward. You better look at the Falcon schematic and see exactly how it should be done, before you attempt it.

To use IDE CD-ROMs you need the ATAPI BOS-driver from CD-Tools
(commercial from Hard & Soft IIRC), or you can use HD-Driver >= 7.50
and emulate a SCSI CD-ROM.

To the harddrive, do you mean ? Sounds ok.

> b) format a 1.44mb PC floppy to 1.46mb Atari Falcon format

Ugh? The format is exactly the same. You shouldn't need to reformat the
disk. The falcon format is 100% DOS compatible.

> c) copy the contents of the folder to the newly formatted floppy
>
> After only 300k has transferred the Falcon reports:

Sounds like maybe a bad disk. Have you tried another disk ? When you
format it, does it go through ok without reporting any bad sectors and a
full 1.44Mb at the end ?

> Destination disk does not have space to continue copying. Attempting the
> identical transfer to an unformatted PC 1.44mb floppy renders the same
> report.

Could also be a bad drive, or even a bad sector on your hard disk from
which it is copying.

> An info check reveals at least 111,000k remaining on the disk yet the
> Falcon refuses to continue copying, saying that there isn't enough room.

111000 bytes or Kbytes ? That would be over 100Mb, which is not possible
on a 1.44Mb floppy.

Cheers,
Nick

Erm... They are the same AFAIK.

But you would be better off with a PC power supply. Remove the Falcon
PSU and power connector. Put some other connector that can deal with
+5V, +12V and GND. Build a cable that allows you to fit the PC PSU under
your desk somewhere (noise from the fan is annoying).

This even leaves you extra space inside the Falcon case for your 3.5"
drive.

You can get those PC PSUs for cheap. I've seen them new for the
equivalent of US$30 around here.

Cheers,
Nick

You are wrong, you can boot from any ID, usually the device with the
lowest ID is used :-) This depends on the driver though, perhaps older
AHDI-versions needed to boot from #0, although I really doubt that.
With HD-Driver you can boot from any ID.

Nope, there's no disk access when doing this.

Also note that you can access all partitions via the keyboard shortcuts
'Alt+drive' and 'Shift+Alt+drive', even when there's no corresponding
icon on the desktop.

Future versions of Thing will have an option to automatically install
icons for all currently available drives.

Nope, IIRC it isn't. TOS formats HD disks with 2 sectors per cluster,
whereas DOS expects them to have 1 sector per cluster. TOS also handles
DOS disks, though, but Falcon TOS has a stupid bug which causes a crash
when creating folders in the root directory of disks with 1 sector per
cluster.

Ciao

I tried multiple disks and multiple copies - all with the same results
which is why I tried formatting the disk in case the Falcon was being
particular.

> > c) copy the contents of the folder to the newly formatted floppy

Yes, at least 5 different disks all of which work well in tests on my PC
(ie...scandisk).

> > Destination disk does not have space to continue copying. Attempting the
> > identical transfer to an unformatted PC 1.44mb floppy renders the same
> > report.

I tried multiple folders to make sure the data was fine. I copied all of
the data to another 800k floppy with no problem. It just refuses to copy
to a 1.44mb floppy.

> > An info check reveals at least 111,000k remaining on the disk yet the

I backed up my Falcon's hard disk to DAT (Wangtek) before re-partitioning
this disk, and was subsequently able to recover all partitions *except*
the first, namely C:. DB3 knows that there should be such an archive
on the tape (even if I rebuild the log file from the tape), but when it
goes to look for it it doesn't find it. This was a file-level (as opposed
to physical-level) dump IIRC.

You can have the offending tape if you want, it's $%^& all use to me. B<[

Diamond Edge, definitely. Used to be distributed in Europe by Hisoft
(http://www.hisoft.co.uk), but maybe some German dealer also has some
left. The producer was Oregon Research, but the rights seem to have been
bought by Mr. Michael White (michael@fastlane.net), who also can supply
the latest version. He has announced to continue developement (if
somebody should be interested), but only after he's finished with the
Diamond Back backup program, which is not an easy task... Best of luck
to him. It's great that someone still believes in developing programs
for us!

It is bidirectionnal and does only have few status lines (not all PC's
ones, so you can't use pc-parallele port dedicated devices)

Well guys, you persuaded me. Let me tell you the story of me and my Milan. It all started when the dsp from my Falcon gave up working. I had just planned to invest in a afterburner or ct2 and a graficscard. But I considered upgrading a half working Falcon not really worth the money. Then came the Milan in the picture. And for about the same cash I had to spend on my Falcon. So I decided to buy a Milan. Also because it (hopefully) offers more upgrade options in the future.

So, I odered a Milan the Milan-tower you all know from the pictures. But that was a mistake...Because so many people wanted that case it was sold out, and I had to wait 4 weeks before they got new ones. But finally I got it. (with thanks to my supplier ACN to bring it home to me personally the day the received it at their office)

So what did I get? A basic Milan in a big Milantower, 16Mb ram, more than 1 Gb Harddisk, a CD-rom with Naes and some mostly boring software. A modern high res. ps2 mouse, and a 80286 PC keyboard of the kind that says 'klick' when you push a button. Really anoying is that there is no key for the '\' and that you have to treat it as a atari keyboard (for example [shift] [2] gives " and not @, as the button shows)

The first acquaintance of the Milan wasn't really positive. To name just a few of the problems: At first my Atari ptc1426 VGA monitor didn't want to work with the graficscard and I had to buy a new monitor. Then the supplied CD-rom was not readable in my 2speed cdrom player. The centronics printer port was connected the wrong way round on the motherboard. And the only working communication port was not connected to a outside serial interface.

Starting up the Milan is a real joy: It goes very fast. Screen updates are very fast also. Realtime scrolling without flickering! Compared to my Nemisised Falcon is the disk access and printing also very fast.
Most programs that work on a TT or Falcon also work on the Milan or else it often helps to switch off the caches. Yet it is a pity that programs as Apex Media can't be used.

Mint and Naes are working great now. It took me some time to
configure it right, but the system now almost never crashes. Still I
hope there will be a MagiC for this system soon.

What I'm really missing are games, like Running. And a standard
soundcard. And finally I hope it will be posible to use the
fastserial port with the next TOS update, because I'm getting sick
with the 19200 Baud I have now.

Ciao,
Karsten

The current TOS available from www.milan-computer.de already supports faster serial line speeds, check it out. There's also a CPX module to set the speeds.

And also note that Woller Systeme (www.woller.com) offers the "MilanBlaster" (though it's currently not mentioned on the homepage), which is a SoundBlaster compatible ISA card with a special driver that installs Falcon-compatible XBIOS-calls for the card. AFAIK it's also possible to just buy the driver, e.g. if you already have a suitable card. The driver isn't 100% stable yet (at least for me, it sometimes doesn't find the card), but usable.

Ciao

Thomas

SdUseMem will do that. Get it from here ...

http://www.swampdog.demon.co.uk/atari/programming/tools/index.html

It's actually a MagiC debugging tool for checking that my code deals
with dynamic allocation failures. However, it just so happens the
nature of the thing allows it to bypass the above problem also. ;-)

I'd ask for more details but as I've never used ICONNECT it probably
wouldn't mean anything to me.

>The dying message from CAB is "resolving
>host".
>
>Thanks in advance for any advice.

Check whatever is ICONNECT's equivilent to the NAMESERVER variable in
STiK/STiNG. This should contain the DNS dotted quad. For Demon it will
be either or both of these:

158.152.1.58
158.152.1.43

I'm not shure, if this is the model, I have seen. That one had a 8086
and used a RLL-Controller. So you need a MFM-Hard-Disk. An IDE won't
work. A RLL or MFM has two ribbon connectors, an IDE has only one.

Arnold.

Forget Oasis. The programmers have quite the Atari scene. AFAIK they are
programming now for pc's.

Oasis 1.35e was a nice piece of soft indeed. I've used it for years
myself despite its many shortcomings and bugs.
Oasis 2.10 was just a piece of sh*t. Never worked for me.
Nowadays there is a much better mail/newsreader. Get Okami 1.34, Newswatch
and Popwatch. All these prg's can be found on the Net.
For instance at the Belgian ftp-site:
193.190.205.13 atari/www.

Good to hear from another user - I'm sure it printed OK on my old STE. Whatever I try, two bombs appear immediately on selecting print. I need hard copy, and unfortunately there's no file export facility either. I did hear once of Sage accounts for Atari.... Perhaps someone knows if printing is impossible, so I don,t carry on trying to think of something - perhaps if I had an Epson printer the Epson PCD might work... Regards

Best Electronics wants $90 plus shipping for the Falcon power supply and
that does not include the metal bracket.

I used to have this problem with WordWriter, and found that I could get
the dictionary to work if I used Geneva and limited the program's memory
to 4Meg via the task manager.

I've been using Ease as my desktop of choice with MagiC for some time
now, and for the most part I like it. I've heard all the kudos give
towards Thing, though, so I thought I'd finally break down and give
it a try. Looks pretty good so far, though the jury is still out.
(I really miss Ease's dirtree popups.)

If anyone has any tips that I might find useful, I'd appreciate them.

Also, is v1.27 the latest English release?

Discovered another great thing about StringServer tonight: its
portability. I've been using Ease and decided to give Thing a try.
To set up all my installed applications in Thing, all I had to do was
enter in a single line for StringSaver. To re-enter all my programs
individually would have been a real hassle.

Props to you, Odd!

BTW, any chance of having the config window come up automatically?
Seems kind of pointless to start with a blank screen and the menu
bar. Would also be nice if it automatically did a Load or a Get.

Just a thought.

Thanks. Great program.

820. !!!Help!!! Megafile 60 dead? Doesn't beep anymore! Is not identified anymore! What to do?

Newsgroup: comp.sys.atari.st
Date: 1998-10-14 00:00:00 UTC
From: Marko K&#65533;ning <kaening@inp-greifswald.de>
Message-ID: <908350210.867989420@news.informatik.uni-rostock.de>
Source record: 91896

Hi,

only two days ago I got my Megafile 60 working on my Mega ST1. That night I spent 7 hours copying and deleting files on that hard disk. Yesterday, when I switched on the HD, I realized that it doesn't beep anymore, moreover I cannot hear that the drive starts accessing files, which normally is some sort of whispering sound... Certainly my HD driver cannot identify the hard disk then... What can I do? Do I have to accept that my HD died from copying thousand files within 7 hrs??????????

The thing is that the green LED burns and the red one switches off after about 30s, during which it seems to try to read from disk...

What can I do? Is there a fuse inside, which protects the HD, or something.....
I don't know... :(

THanks in advance.
Marko

P.S.: Thanks for help concerning HD driver which I received a few days ago!!! Finally I understood that my HD driver was okay, nevertheless I installed the new AHDI6061.LZH, since there was a program ODIN.PRG in my auto folder, which was obviously requireing a newer TOS than mine. Too sad that my HD finally seems to have stopped its activities... :(

Message-ID: <36245A84.B7E@gate.net>
Source record: 91897

Does anybody know what to do about those annoying little pops that I hear in my songs using CAF 2.06? I have a 4 meg Falcon 030 with a Soundpool FDI and all timing and audio circuit mods done...yet still i get these annoying clicks or pops during playback...even only a couple of tracks. I am using a Jaz drive and a Maxtor 7345 scsi drive.

Also...is there a way to use 16 track mode and still have the 2 little aux sends that the reverb and graphic eq have on each channel?

Thanks!
Shane

> Does that power the chips that access the floppy drive?

Apart from a bit of biasing for the motherboard chips the 12v supply's
main job is driving the motors of the floppy and hard drives. If
there is no supply the drives will not go 'ready'.

>Plus if I do put the ide drive on, there's a fant clicking noise
>from the power supply area and the power light flashs dim and
>fast too.

Hmm .. not an experiment to do too often. It sounds as though the IDE
is causing a big current drain on the PSU which is even pulling down
the 5v supply (power light). You must check the IDE drive itself and
the cabling to it.

When I turn it on, it starts to spin up, and then stops, and the access light just flashes. Iomegas return policy sucks. I should be able to take the drive down to Comp USA and exchange under warranty, but I have to send the drive to Iomega and then wait for them to return it. That's the last Iomega product I ever buy. The thing lasts less than I year and is a pain to return.

Greetings;

Take the cover off the drive - give the physical drive a good whack on the side. If it starts, make a backup of all the data. Note the drive # (should be a seagate rll of some kind). Go to the used computer place and purchase a new unit for $10. Install it and do a restore.

Far as I know - there is a coating on the drive platter which deteriorates after time. When it's mostly gone, the drive heads will stick and the drive will not spin.

Sounds indeed like the drive is toast.

Willard.

I think the dim flickering is some kind of indication from the BIOS that
it filed to complete the boot sequence. (Could be wrong though).

Hi Sanskrit,

put the following line in your pacifist.ini file:

mount=d:\atari

where the drive and directory represent the hard disk.
mount=c:\ will mount your entire C drive
mount=c:\atari will mount the directory c:\atari as your atari drive c:

Good luck

Tom

Forget Gemulator. For games, use pacifist or winston. For applications
or gem software, use tosbox which you can get from:

HTTP://www.geocities.com/SiliconValley/Vista/4448/

Tosbox is an excellent emu for using atari applications. You can get
high res 16 colour screens, etc.It runs multitos, nvdi and Calamus SL
works like a charm on it, in colour yet!

Roger,

it would be nice to have some figures around as to what the Atari PSU's
actually CAN deliver... I know the old ST one was rated at 65 Watts, but
how much that actually is on the 5 and 12 Volt lines is unclear. Haven't
got a clue what the standard Falcon PSU is rated at, although Nick
mentioned it's the same one as the ST's. If you compare that to a simple
standard PC PSU rated at 200 Watts it's simply a laugh.
Haven't got a clue either what the TT's PSU rating is, nor what the TT
normally would eat... It would be handy to have some data available.
So if there's anyone around with some figures, please go make them public!

That's what I've always heard anyway. There are several designs, but I
would bet they are all built to the same spec. The Megafile also uses
the same PSU. My STE is running with an STF PSU, which is happily
feeding a 2.5" internal drive and 4Mb of RAM.

> If you compare that to a simple
> standard PC PSU rated at 200 Watts it's simply a laugh.

Yeah, but the ST PSU is smaller and doesn't include a huge fan.

Not sure about this, but maybe they could be in the Falcon and ST
schematics on
http://www.geocities.com/SiliconValley/Way/8016/atari/sthard.htm

I couldn't read schematics if I wanted too.

It might help to de-fragment your disk. I use Diamond Edge. It might be hard to find a copy. Try Toad computers.
If you use 16 tracks you give up reverb and EQ. Also no stereo recording under 16 tracks.

You could probably even find a PC power supply that will physically fit inside your falcon case in place of your falcon one. A lot of power supplies are quite small these days. Just take it out of the metal box. You will have to do some wiring and maybe make up some brackets to mount it inside, but a PC power supply will most probably do a better job than the original.

It's a shame your not in WA, I've got one here you could have. You'd want to check the PS for heat, but I've found that a lot of these units don't get very hot without a fan anyway. You can always mount a mini fan in there with it.

regards

Steve.

Hi!

Karsten <tjendol@wxs.nl> wrote:
> > [MilanBlaster available]

> This is really great. I knew it was being developed (I could order it
> with my Milan already) Didn't know it was ready. How does it sound?
> What programs does it work with and which not?

Well, it sounds like any other SoundBlaster compatible card. Nothing
impressive, but still with less noise than an unmodified Falcon.

And all programs which use the Falcon's XBIOS calls and properly check
the '_SND'-cookie will work, though the sound may be a bit too fast or
too slow due to the incompatible frequencies of the Falcon's sound
system. There's also a little program which installs a 'McSn' (or so)
cookie and enables some prgrams to work (IIRC this cookie originated
from a program for MagiC Mac).

> Actually my point was that a card like this should be part of the
> standard Milan. Just like the grafics card.

Don't agree here. As Uwe has already stated, not everyone needs a
soundcard in the first place (which isn't true for a graphics cards), so
I think it's quite OK to leave this decission up to the user. And of
course there will be dealers which offer Milans with an pre-installed
soundcard.

In fact, the config sold to the customers is fully up to the dealer.

Ciao

Thomas

No,if you knew anything about gardening, you would know that
nither dog or cat waste are useable in gardens. This product is
something that I've been working on for close to 5 yearsand
testing it on many plants and it is now ready for the market.

If you don't want NEWSie to delete the mail, don't ask it to.
Use the new Selective Mail Retrieval, turn off the 'Delete Mail from
Server', and delete them only when you decide you want to.

The Selective Mail Retrival is there to prevent just this problem.
Its there, please use it.

Need some space, so I'm clearing out some of the big stuff. All items are
AS IS. Working Mega STe motherboards will be tested before shipping to
make sure they power up and still work.

Working Mega STe Motherboard
$50 (no RAM, TOS or Power Supply)
$85 with TOS 2.05 (limited supply), 4 1 Meg SiMMs, and Power Supply

720k Epson Mech Floppy with Small Rhombus Eject Button
(Used on 1040 STe's, Mega STe's, TT's, and later Mega ST's)
$17.50 each with purchase of a Mega STe Motherboard
$25 otherwise

Non working Mega STe Motherboards
$20 (no RAM, TOS, or Power Supply)
$35 with TOS 2.05 (limited supply), 4 1 Meg SiMMs, and Power Supply

Mega STe Power Supply
$5 each with purchase of a Mega STe Motherboard
$10 otherwise.

4 1 Meg SiMMs
$10 each set with purchase of a Mega STe Motherboard
$15 otherwise

TOS 2.05 2 Chip set for Mega STe
$30 (limited supply)

Non-working 1040 ST motherboard
$15

Working 1040 ST's with internal floppy and TOS 1.0/1.2 (Machine Only)
$40

Xtra-RAM SiMM boards for STs
$40 for 2
$50 for 2 including 4 1 Meg SiMMs
$58 for 2 including 8 1 Meg SiMMs

Portfolio PC Card Drive
(ISA Card to plug into a PC to read Portfolio Flash Cards)
$15 til 10/25/98

Portfolio Parallel Port Interface
(Connect a Portfolio to a printer or a PC through a LapLink cable)
$12 til 10/25/98

> of beating :)

The same feelings here. N.AES/MiNT is really a good working combo. Stable
and very compatible. Even old prg's like 1st Word plus 3.15 and Superbase
pro still works.

Ah... now THAT might be the cartridge. Unfortunately it's a little expensive to have to get another cartridge to check it out with.

Same thing happened to me when my first Jaz drive died... I had to send it in and wait for it to come back. I finally ended up going out and buying another one because I couldn't access anything on the cartridges, so now I have a "spare" drive, just in case it happens again..

I've had a couple of cartridges die too. They've replaced them, but then again I lost everything on the carts.

My feeling is that removable media hard drives are inherently risky, since the drive platters and head assembly aren't sealed as in a typical hard drive.

I had similar problems with a SyQuest EZ135 drive, and I've heard of people having the same problems with earlier removable media drives.

(Incidentally, you should take a look at www.ebay.com if you're interested in getting more Jaz cartridges. There've been some going for as low as $50-$60 recently!)

It's most likely a problem with the CAB.OVL, since CAB never (and I
mean *never*) freeze here with the later CAB.OVLs for MiNTnet. CAB is
also very stable (although a bit slow) with PPP-Connect under MagiC.

I remember seeing some postings months and months ago that there
where some beta testers using Oasis 2.10 or a later version. I believe
a few where testing it here in the US.
Anyone know if version 2.10 or a later version actually was useable
with PPP?

>Better than plug and pray:).

Hi Mike,

That is just what I wanted to hear, I suspected that using ribbon
cables would probably work. Just didn't want to take a chance of
destroying good cards by experimenting.
One could obtain some type of empty case to house the Falcon cards.
Would a setup like this require a fan for keeping the cards cool?

If a situation arose in which 2 software programs accessed 2 cards
at the same time. Would that be a problem?

Also, is it necessary to put headers on the cards and stack them?
Or can one place a male 30pin and 50pin connection for each card
on the ribbon cable?

Thanks for you help,

I think I am using v2.1, though it maybe v2.05. It is certainly the
latest version I ever found.

I could never get ICE to be stable and I persisted with it for far
too long. Using Oasis with Sting, and Gary Priest's NEWSwatch and
POPwatch gives a stable setup.

Rich.

Word Writer ST also runs on the TT, unless you try to use the dictionary
or thesaurus. The reason I guess at is that those files are encoded, and the
decoding routine expects word-length, 16 bit, memory organization, and does
not find it on a Falcon or TT. If there is a better explanation, please
tell me.

I'm not sure about that. I seem to recall there could be problems with Megafile drives
since they contain RLL-drives that are too slow, which may cause trouble sometimes.
Otherwise, Diamond Edge is just great. I use it all the time.

As far as I can tell the fan (a real flat muffen fan) is part of the stock machine, something like the TT's fan. I've tried with the wires unconnected (the switch itself I took out) and thefan doesn't run, with the wires twisted together, the fan runs. And doing them both ways both with and without fan running the machine acts the same.

Never having seen the inside of a true factory stock Falcon, I can't tell you what is stock or aftermarket, that is but for the keyboard mod, that I KNOW is after market. Now I have a $500 pile of parts not working. Don't worry, not blaming anyone, it's just normal for me, if I didn't have rottenluck, I wouldn't have any luck!

>Did you remove the jumper on the expansion bus? The Falcon will not
>work unless this is installed and installed properly (unless you have
>another device installed in the expansion slot).

jumper? What jumper? expansion slot?? is that the empty row of pins that would have beenunder the keyboard?

And I put the cable in just as you had it printed. As I said, the 1st night it worked just fine, then it sat for 5 days and then when I powered it up, will the rest is history and so is my falcon.

Glad you like 'em. Sorry, I'm not far enough along to plan any releases
(not even beta stuff). The only thing I've done so far is:

1) Attempt to re-organize and understand Diamond Back (quite a
bit of time here, actually)
2) Add -some- of the new menu items (they don't do anything yet)
3) Think about how to do some of the stuff I'm planning

I hope to have a web page up some time in the not too distant
future.

I'm in perfect agreement with that statement. And do I hate having to
go back to TOS for the odd programs I use that isn't Magic compatable :(
I just wish Timeworks and Tempus 2 would work with it.

The trouble with this is, if you ask Newsie to get the mail and then
you find the mail is corrupted, it's too late. Newsie opens the POP3
connection, gets each mail, marking it for deletion once collected,
and, after the last mail is collected, closes the connection. And,
since the mails are deleted as soon as the connection is closed, you
can't go back and re-fetch them.

Of course a way round this would be to leave the mail on the server
until it's checked. This then causes the problem in that you may receive
more mail in between doing the fetch and deciding that they've all been
correctly received. In this case you'd need to pick out the ones you've
already got, mark them for deletion and fetch the ones you don't have.

This sounds very much like a problem I have with browsing without a proxy cache. What I think is happening is the URL is resolved but the hosts server isn't working. Without a proxy, CAB seems to wait forever for a connection that's never going to be made. With a proxy, you connect to the proxy server and that attempts to make a connection to the host server that's down. As you've got a connection to a working server, CAB is able to be interupted, so you can press stop at any time and go to another URL.

If the proxy is unable to connect within a set time period, which with Demons proxy server is a rather large 90 seconds, it should/will send a page stating the reason for the inability to connect. These, for me, are usually an error 312.

>can stop those, but not CAB. Will this be taken care of soon? Thanks!

I'm not sure if this problem has been resolved or not, but I think it would be a good idea if both CAB and CAB.OVL were able to be interupted before, during and after a connection is made. I'm not sure if the overlay is the right place for this sort of thing, but it would be nice if there was a user-defined time-out for when a server is unreachable or not responding to connection requests.

My experience was the same. The base word processor worked OK
with the exception that it got pretty goofy about screen redraws
when I used BlowUp... I eventually gave up and used AtariWorks.

I tried the version of WordWriter ST I have on my 4meg Tos 1.62 STe
and everything works fine. I'm not exactly sure what version I have
though. The (About) word writer dialog says 2.00, while the original
disk labels say version 2.01.

I have installed WW ST many times on my Falcon trying different
things including Backwards and it works fine except that when I select
the Dictionary or Spell checkers, word writer starts reading the info
in the WWDICT folder then exits back to the desktop with Tos 4.04 or
gives 2 bombs with Geneva/NeoDesk.

What version of Word Writer ST does the (About) dialog report in your
software?

I have noticed the same thing on my Falcon with STing/Cab. It seems
to happen more often than it use to. I went back to using one of the
older 030 OVLs and the problem is still there. Once it happens I have
no control over anything except my mouse and have to re-boot unless I
want to wait for 30 minutes or so for the connection to finally time
out. This problem has even appeared on Atari Web pages.
Very annoying.

886. Obituary (of interest to XEST readers)

Philip Thornton and has wife Ann were buried today in St, Barnabas' cemetary in Blandford Nova Scotia, Canada. Their 21-year old son is in custody, charged with the murder of the couple who were found shot to death in their home Thursday morning in their home. A firearm was siezed from the scene.

Atari User Group enthusiasts, and particularly those who read hard-copy newsletter/fanzine publications from the User Group community, will know of Phil as the editor/publisher of XEST newsletter from the Nova Scotia Atari Computer Users Group in Halifax. Phil Thornton was responsible for the layout and assembly of all issues from January 1994 to July 1996, and his software review of OUTBURST! was re-printed in several other newsletters.

There were nearly 300 people at the funeral this morning, spilling out of the Church onto the lawn and across the highway.

I have had problems with bad keyboard mapping on my Hades. I found a
useful utility program called Keyedit that allowed my to re-map keys.
You can find this utility on K Ellis' FTP Server (which is only available
when she is on line).

Take a look at her home page : http://www.primenet.com/~kellis

> What I'm really missing are games, like Running. And a standard
> soundcard. And finally I hope it will be posible to use the
> fastserial port with the next TOS update, because I'm getting sick

I though the Milan had two serial ports - one MFP compatible running at
a maximum of 19,200 baud and one PC compatible serial port running at
a maximum of 230,600 baud?

Regards,

Ben Hills.

If your running MiNT, the MiNT Prozesse CPX will allow you to kill the
CAB process. Not clean, and sometimes a reboot is necessary, but it
works.

In fact <blush> the missing drive icon was there all the time, Thing added
it in a corner that I'd overlooked (I'd used Videlity to expand res. to
800*608 and hadn't moved the original drive icons to fill the new space).

Jo Even Skarstein wrote:

> AHDI-versions needed to boot from #0, although I really doubt that.
> With HD-Driver you can boot from any ID.

This is not a question of the hard disk driver but a question of how TOS determines the drive to initially load the hard disk driver from. TOS checks each device ID in ascending order, first IDE, then SCSI, then ACSI. The first device that has an executable root sector (this sector is usually executable if a hard disk driver is installed on a partition on this device) gets the boot device. If, for example, you have connected two SCSI devices, one with ID #0, the other with ID #1, and on the #0 device no hard disk driver is installed (no executable root sector) but on the #1 device a driver is installed, TOS will use device #1 as boot device. Once again: This applies to all hard disk drivers because it's not up to the driver (it has not been loaded at this stage) but up to TOS.
After the hard disk driver was loaded drivers like HDDRIVER enable you to load any subsequent data from another drive. HDDRIVER even allows to ignore the drive where HDDRIVER itself was loaded from completely. (Useful in very special cases.)

If your running MiNT, the MiNT Prozesse CPX will allow you to kill the
CAB process. Kind of dirty, and will crash the machine sometimes, but
you get a quick exit most of the time and just restart CAB.....

I have noticed the hang today trying to download Adobe Acrobat from
the Adobe site. I got all the way to select file for download, then
CAB just hung, but then so did Communicator on the Mac.....

Where is our compatibility web page?:).

> (commercial from Hard & Soft IIRC), or you can use HD-Driver >= 7.50
> and emulate a SCSI CD-ROM.

I think I should clarify what HDDRIVER really does because emulating is not quite the right term. The generic SCSI driver integrated in HDDRIVER doesn't only provide for sending SCSI commands to any SCSI device but also to ATAPI devices. Basically, though oversimplified, ATAPI devices are SCSI devices connected to the IDE bus. They offer the nearly the same command set SCSI devices have. The generic SCSI interface of HDDRIVER makes use of this and programs like SPIN!, which completely rely on this interface to access devices, work with ATAPI devices though they were initially written with SCSI devices in mind. Except hard disk drives most devices that you connect to the IDE bus are ATAPI devices and thus are supported by the generic SCSI interface of HDDRIVER 7.5 and newer. SCSI commands are not emulated for them but are directly send to them using the ATAPI protocol.

This wouldn't fit the concept of the Milan which means that you buy a machine without add-ons for a fair price and can add additional hardware as you please. That's exactly how the PC market works and most users want it this way. A built-in sound card would result in a higher price for the Milan and this is probably not what most users want. If, for example, you don't want a sound card at all, why pay for it?

A feature I've never seen in a POP3 mail reader is one whereby the
reader 'lags' behind by one connection. By this I mean it marks
internally what you want to do with the emails but doesn't tell the
server about it until next time it connects. I've always thought this
would be rather good for spam: for each new email it just downloads
the header (plus a user specified number of lines from each email)
whereupon you'd mark the spam as 'spam'. Subsequent connections
normally wouldn't show those spam emails to you again - they'd just
sit there until your ISP bounced them back as undelivered. Naturally
emails that had not been marked as spam would be fetched in their
entirety next time.

Such a scheme goes 99% of the way towards implementing a solution to
your problem. Adding a few extra options would solve it.

Digressing a little ...
Actually, I'm inclined to think of the above more of a server than a
client. If there were a dedicated POP3 program then it could be
controlled by all newsreaders. Assuming this to be the case it would
be easy to replace that POP3 program with one that behaves in the
above manner and no newsclient would be affected (or even aware) of
what was going on.

Sometimes it can pay off not to be too technical. All this sounds
exactly like the scenario I go through when one of my ST(E) power
supplies has gone belly up.

Very occasionally I find they can be revitalised by running a
soldering iron over the joints on the underside of the psu. By this
time the damage is done though and I'm lucky if it works for more than
a few days, sometimes a week or two. Bear in mind my hd has its own
power supply so I doubt it's even worth the effort unless you keep the
IDE disconnected!

You can defrag yourself if you've enough space simply by moving the
contents of one partition to another (and then back again) - or in
this case, move all the "sound files" from where they are to an empty
partition and use them from there: same effect.

Ensure you've got enough folder memory assigned so the 40 folder bug
doesn't crop up though!

When you say 'indentify' do you mean the SCSI command 'Identify'? Try running a few more HD utilities which scan the SCSI bus and report what they find. I would like to think that, at least, the 'Identify' command works.

>What can I do? Do I have to accept that my HD died from copying
>thousand files within 7 hrs??????????

Sad news but I think it is not very likely. This sort of activity is often used to free-up a drive whose spindle is getting 'sticky'.

>The thing is that the green LED burns and the red one switches off after about
>30s, during which it seems to try to read from disk...

I'm not sure about what happens on Megafiles but I guess the green LED shows that power is available and the red one is monitoring disc activity on start-up. Does it usually do this? If the drive was a true SCSI (which it isn't!) this activity is normal during POST (Power On Self Test).

>What can I do? Is there a fuse inside, which protects the HD, or something.....
>I don't know... :(

No, it won't be a fuse problem if red/green LEDs work.

First: check the cabling from the ST to the Megadrive and, inside the megadrive, the cabling to the adapter and from the adapter to the drive. It may have become disturbed with all that activity (!) or the contacts may have become dirty.

Second: re-install the disk driver. If sector 0 has become corrupt the driver will not be loaded on boot-up.

Third: run some diagnostics. Have you got HDCHEK13.TOS? Or something similar which may say just what is going wrong?

If I had to bet on the fault my money would be on the cabling.

Yes, c'est vrai, mon ami! I have no data on the PSU capabilities but
they are all of the same sort of size and similar to others I have
seen which deliver 60-80 watt.

I think that you have to use the rating as an 'overall' figure for
switching PSUs - you can distribute the 60 watts over both the 5v and
12v rails. This is NOT true of the original ST 'brick' PSU which was a
straightforward transformer/rectifier type and has a definite (and
low) limit in what can be drawn from the 12v line.

>Haven't
>got a clue what the standard Falcon PSU is rated at, although Nick
>mentioned it's the same one as the ST's. If you compare that to a simple
>standard PC PSU rated at 200 Watts it's simply a laugh.

I'd guess at around 80w. Yes, these Atari PSUs are a dead loss. I am
using a PC PSU to power my kit. In the other room I have a Mega4 and a
1040 (4Mb) both of whose PSUs are blown. It's a shame that it's
difficult to find other cheap PSUs which will fit the space allowed in
the casings as they are both run by external PSU at the moment. I have
looked through a lot of PC junk but all that I've found are too
chunky.

I tend to go between the two desktops.I registered Thing V1.27 and
use it most the time but my problem is memory as Thing does use alot
of memory.I am using an STE with 4Mbs so its quite tight with MagiC
as well.

Even with AVServer installed with Magxdesk is still does not support
all the AV-protocol functions as Thing does.Thing would have an
advanage here.

Good choice.I have never tried EASE so I cannot comment how good or
bad the desktop is.The past few days I have been changing my mind in
which desktop to use.Because of memory problems I went back to
Magxdesk but I always go back to Thing.I am driving my girlfriend
crazy because I am always changing my mind.

Thing has popups as well.Just press the right mouse key anywhere
outside of the windows and it gives you access to your drives and if
you right click inside the window another popup comes with you can
install apps. and other things.Try it for yourself.

>Also, is v1.27 the latest English release?

Yes,Thats the latest version.Its on my website.See sig below.:-)

Yes, maybe it just got stuck in this self-test somewhere... You know, normally
the drive showed some activity, you could hear how it starts up, there is a
very characteristic noise... But this is absolutely absent now and evenmore
the READY BEEP at the end of HD initialization is not given anymore.

> First: check the cabling from the ST to the Megadrive and, inside the
> megadrive, the cabling to the adapter and from the adapter to the
> drive. It may have become disturbed with all that activity (!) or the

I will check what cleaning brings. I did do the whack from the side and many
more things, but it didn't change anything...

> Second: re-install the disk driver. If sector 0 has become corrupt the
> driver will not be loaded on boot-up.

If I start the ahdi.prg from floppy it also cannot identify the device 0,
meaning the hard disc.

> Third: run some diagnostics. Have you got HDCHEK13.TOS? Or something
> similar which may say just what is going wrong?
I will try to find it. At the moment I have things like

hp_opt23.lzh zorg_203.lzh chkdsk3.lzh sttoo193.lzh zorg_210.lzh

I hope that I can somehow revive my HD, it would be sad if it wouldn't be possible. This devices are so incredibly cheap, but also so rare here... Not to talk about the waste of time...

Thanks so far.
Regards, Marko

The PSUs on my STe and STfm are not the same as that which was originally in my Falcon. I have no idea what the ratings are but the fuse on the Falcon supply is twice that on the ST units. The Falcon's used for my BBS and the PSU failed a couple of weeks back on a reboot cycle. I'm lucky that my machine came in a DeskTopper case and we shoehorned the innards from a standard PC supply into the top, trimming the heat sinks to allow the case to be put back on. The PC fan was miles to big to fit the DeskTopper so I bought one from a local electrical oddments shop and installed that instead, blocking off all the other vents on the upper case with tape.

The power connector is not a standard PC one so it was poached from the defunct Falcon PSU and the appropriate leads used. The new setup runs much cooler than before.

The whole thing cost me about twelve pounds, inclusive.

Keith

After my Jazz drive crashed, I started using a ram disk for internert stuff. CAB and Newsie work so much better and faster. Anyway, is there a way t set newsie up so that the "default.grp" and "xover" files stay in the newsie directory while my ofline and work paths stay on the ram disk.

Also, Atarirc won't load the RSC file is I change the paths to use the ram disk.

> (I really miss Ease's dirtree popups.)

Well, the next version will have "spring folders" (like Jinnee or MacOS 8) for that. For now, Thing has an undocumented feature when PopFold is running, but there's a good reason why it's not documented because it only works when dragging files between directory windows and is not configurable at all.

> Also, is v1.27 the latest English release?

Yes, it's even the lastest release at all. And please note (looking at the subject of your posting), that 'Thing' is /not/ intended to be the English word 'Thing', but the Germanic (not German) word for something like 'meeting place', which is pronounced 'Ting' or 'Ding'.

Ciao

Thomas

Hi Thomas,

good to know, I Hated this non-configurable way of "undocumented feature"
:-) Being able to set timing would be very nice.

Another nice thing is to know what the name stands for... really a
surprise to me.

Finally, could you email me about the registering costs, I registered
Thing years ago with Arno but I understood they cracked some codes and you
want those users to register again.

Roger, these must be the units that made the lower prices for the Atari's
available I guess...
If it's not the "switcher transistor" that fails after some time, it's the
bloody red capacitor that "grows fat" and meanwhile all the other
capacitors loose capacity. My old ST's PSU just had a major upgrade
shortly before the RAM upgrade said "Goodbye", so I've got a spare one for
the other ST I'm running...

The TT's PSU looks still OK, but again, it's feeding the machine plus the
Atari TT board expansion, the Matrixcard and a 850 megs HD. I really don't
trust it with the Aixit board due here with 64 megs, although modern Simms
probably take less than the old ones.

Don't know what the situation in the UK is, but over here you buy empty PC
towers for around USD 30,- including a 200W PSU. All the extra gear I've
got is housed in this tower. I don't even notice its fan running but then
again this TT fan sounds like an idling Pratt & Whitney :-)

I still gather the best thing one can do upon an Atari PSU failing, is
buying a PC one, fit a socket into the Atari to connect it to and get rid
of the noisy fan at the same time. Usually the other hardware doesn't need
a fan at all.

I do not know. Many years the problem returns: one wants to
defragment.
I have waited for software that does it "flawless all the time".
Always I hear sometimes after half a year or longer of regular use of
a product from a user that 'things went wrong'.
My conclusion: the best defragmenter is yourself.
Simply move the contents of a partition to another and back!

That's not quite what I meant. I was talking about Ease's ability to click on a drive or folder and have popup trees for enclosed folders, which can in turn be clicked on to get to the next level and so on. Kind of like hierarchal menus on Macs.

For example, if I want to copy a bunch of files to C:\FILES\STUFF\JUNK\, normally I'd have to open C: then FILES then STUFF and then JUNK. With Ease I don't have open any of them. I can drag the files to the C: icon, keep the button held down and just wait for the dirtrees to come up, highlight JUNK and let go of the mouse button, and it will copy the files to that directory, without having to open any new windows at all.

But if I DO want to open that window, I can do the same thing by just clicking on the drive icon and holding down the button to get to the nested directory I want and then let go. So I only have to open the folder I want and not all the parent folders first.

Hope that makes sense.

Hi Terry,

well, as a undocumented feature it exists since version 1.20 I believe,
the only thing is: time in which this happens is fixed. Thomas will
implement a better working version in a next update I gathered. To be able
to use the undocumented feature now, you need PopFold, which I got in the
Jinnee demo and left in my MagiC apps folder :-)
The way this feature is incorporated into Jinnee is awesome, it saves
lotsa buttonclicks (and thus microswitches).

Other features I like in Thing are the right-click = double leftclick
simulation as well as the realtime scrolling in windows. Plus the AV
protocol implementation. When supported right, you can even choose the
color of your fonts in another program thru' the Thing fontsel. Pity that
feature isn't supported much (yet)...

That's almost what POPWatch does. It allows you to pick specific messages
and either download or reject them.

>Such a scheme goes 99% of the way towards implementing a solution to
>your problem. Adding a few extra options would solve it.

I don't have any problem with anything like that. I've not yet had a
corrupted mail and, as for spam, the reject feature in POPWatch takes
care of them.

>Digressing a little ...
>Actually, I'm inclined to think of the above more of a server than a
>client. If there were a dedicated POP3 program then it could be
>controlled by all newsreaders. Assuming this to be the case it would
>be easy to replace that POP3 program with one that behaves in the
>above manner and no newsclient would be affected (or even aware) of
>what was going on.

That's almost POPWatch again. It works with OASIS 2, NOS, Okami and Newsie
and, as these are probably the most used mail/news readers for the Atari,
there shouldn't be any problems using it.

BTW, just in case anyone thinks I'm Gary in disguise, I'm not. Honest...

As I haven't used the selective mail retrieval option, I didn't think of
this. As for turning off the delete mail from server, I did say that was
an option.

Hi,

just came across an article in an old Atari mag (june '92) that tells me
TMS (the Cranach people) were introducing on the CeBit '92 GFX cards by an
American company CyberCube, that not only supported resolutions up to
1280x1034 in 24 bit, but also had 2 networking sockets capable of 20 Mb/s.
Names stated were "Sunrise", max 800x600x24 plus Networking stuff (at US$
1500,- then) and "Skyline, max 1280x1024x24 plus Networking, price unknown.

Anyone with info on those (VME)cards ???

You can change how the cab.ovl determines it's online status from
within the ovl.cfg file supplied with the cab.ovl. Some versions of
the ovl don't seem to work properly with some versions of CAB and
STing. Start with an earlier ovl and keep tryiung newer ones until
the problem goes away.

Mario,

As far as I know, there is no Atariworks 2.07. There was a beta
version 2.0 released to testers but I don't think it was ever sold
commercially.

A funny thing happened yesterday, on one of the garden type e-mail lists I'm a member of, we got to talking about hard drives crashing.(wonder whoever said anything about that?) and it turns up that one of the other users used to work for Seagate, and in fact, ... he WROTE most of the Firmware for the early scsi hard drives! Almost ALL of the firmware for the old ST-225n (he says 1st scsi drive with embedded commands/firmware) was written by him.

You just never know who you'll run into online, I've got one of those old 225n's and like he said, I think it'id take a Nuke to realy kill it.

Oh he did say those little 2.5 drives were all a round a bad deal for seagate/conners, lots of them suffered from stickon.

I think that maybe by Jan. I might be able to pick up a multi-meter, then I could check some lines comingfrom the power supply.

Just to satisfy my curiosity, I just loaded WW ST while online w/ Flash II
(on my Falcon). I loaded a text file, ran the spellchecker using my
own .PER dictionary file, changed spelling on a few words, saved, and
quit the program - no problem other than about 2 minutes to load my
dictionary file (it's large). I forgot to try the thesaurus but I've
had no problems with it in the past.

Hey JoNK, it's MenU..
Well, as everyone knows, or might guess (I run a MagiC Support Page) I'm in favor of MagiC, there are so many reasons, but to sum it up, I stay with MagiC because:
It is commercial and it is constantly being developed. Even IF magiC is not stable now (it is here, btw) it will (hopefully) become more stable for all users. No software is perfect, and MagiC is no exception, however, it is a great OS and has even great potential.
2) When I run MagiC I feel like i'm running a modern computer. Everything feels more modern, more snappy. I have MiNT installed aswell , but hardly use it. MiNT is awsome, just has nothing to offer me. Everything I need MagiC does (and it Does Not crash here allot, but unfortunatly many have had complete opposite experiences :-(
3) and finally Software such as ASH Emailer, jinnee, etc, which all either need MagiC to run or are optimized for magic..
well, thats just my 2 cents..

How are symbolic links managed on the Mac and the PC with MagiC ? Are MagiCMac and MagicPC using the relative OS aliases or does it work as on the atari or simply is it not working ?

Ciao, ** *Mike* ** www.interware.it/users/mike/ mike@interware.it

I am trying to get my old Ataris to work but it has proven unsuccessful beacause I am missing some pieces, if any one can help me get these things it would be greatly appreciated.

The things I need Powersupplies for the Indus Gt disk drive, the Atari 800, the Atari 800 XL, and the Rana Systems 1000 disk drive.

The cord that goes from the Atari 800 XL to the tv/Atari box.

two tv/atari boxes that hook up to the TV.

I will buy or trade these from people people interested.

Please e-mail me at bentwoobie@aol.com

954. Nova drivers and NVDI

Newsgroup: comp.sys.atari.st
Date: 1998-10-16 00:00:00 UTC
From: shammond@loop.com
Message-ID: <708anj$fo5$1@supernews.com>
Source record: 91745

Hopefully someone with a TT and a Nova board maybe able to shed some light on what is going on. Below is the text of an e-mail I sent to Nima with the problems I am having in getting any NOVA VIDI driver later than 2.52 to work with my Nova Plus. So far I have not gotten a reply and I would really like to get NVDI 4.11r working on my TT :).

Nima,

Just wanted to let you know that I have been unable to get either of the new Nova VIDI drivers you sent me to work correctly with my system - TT 030 with 4/16 megs of memory. The Nova card is a Nova Plus (according to the check mark on the box). When I install new software, I do it using either TOS or MagiC 4.0 with all extensions/system enhancements turned off.

Here is what happens:

1) Used the install program that came with 2.61 to install the drivers to my AUTO folder (after removing current -2.52and related files- to another folder). Re-booted. The Nova boot screen comes up white and red - color palette of the computer is altered. Cannot get the
computer to work in any color rez except for 2 color. Cannot change the color pallette using the Nova CPX. Cannot reset the color palette using the Nova CPX. Cannot get the VMG program to work correctely except when using 2 color mode. IOW, if I get a good pattern in 2 colors and change to 256 colors, then hit "set values", nothing happens. No pattern, no nothing, all I have is the VMG program screen. Changed Nova VIDI driver to 2.66 - get the same problems as with 2.61.

2) Replaced the emulator prg. from 2.61 with my original emulator prg. Now color pallette is correct for both Nova boot screen and main program screen after Nova VIDI driver loads (2.61). However, can still only run in 2 color - same problems as in (1).

3) Replaced emulator prg. with one from 2.66. Now, at least, color pallette is correct during boot. Still can only run in 2 color mode using either the 2.61 and 2.66 drivers.

Now, as soon as I replace either 2.61 or 2.66 with 2.52 my system is back to normal. In all cases I have not changed the menu lib - so all of the drivers are looking at the same monitor settings.

Do you have any idea what in the heck is going on? I really would like to get this figured out as I have NVDI and would like to be able to use my computer in normal color modes. I guess my only other option would be to sell NVDI and upgrade Speedo, if that can still be done.

TIA

Steve Hammond

955. Re: That THING You Do

Newsgroup: comp.sys.atari.st
Date: 1998-10-16 00:00:00 UTC
From: outrider@lvdi.net
Message-ID: <36273e7061078500@lvdi.net>
Source record: 91746

I have a few directories with filenames apparently too long for
Thing. Everytime it reads the directory, it gives me an alert
telling me that filenames were too long and couldn't be read in.
Very annoying.

Is there any way to get to these filenames in Thing, or do I have to
load up Ease or Magxdesk to shorten the names so that Thing can read
them?

My Atari equipment for sale is:
Mega File 30 Atari Computer
Atari ST Computer
SLM 804 Atari Laser Printer
Syquest 2 Cartridge Hardrive (40 megs in each cartridge)
The Link from Atari to the Syquest
Cubase Midi Sequencer (from Steinberg Jones)
Band In A Box Midi Music Program
Calumus Desk Top Publishing Program
would you have any offer in mind for any part of the above or ALL of the above?

Jo Vandeweghe had similar problems with his NOVA. Ends up his chipset was
a Mach32 and not a Mach64, so the newer drivers (2.61/2.66) didn't work
except for monochrome. NVDI 5 supports all graphic cards -- there's no
need for the NOVA VDI now. But I'm still runing NVDI 3.02 ;-)

Neil,

Thanks for the reply, but it was my understanding that 2.61 was suppose
to work with Mach 32 cards. I guess I will have to upgrade my version of
4.11 to 5.

This is only half true. This will mark the file as deleted, but will
leave the clusters still marked as used. You would also need to edit
the FAT to mark all of the clusters used by the file as unused, '00'.
This is what is tricky to do, although I have done it on occasion.

I've not had any problems with First Word Plus. If I set Magic to single
task Word, it's perfectly okay. Then again, I rarely use Word, as my
preference is for Protext for WPing, or QED for plain text editing.

>Thanks for the info, you've saved me a fair bit of cash. :-))

If all you use your ST for is DTP with Timeworks, then Magic isn't going
to be a great help. To tell the truth, there's not much software I've
got that won't work under Magic. In fact, with the exception of Devpac 2
and Timeworks 2, I haven't found much else that wont work. Some programs
need to be s/tasked, but most are happy to be m/tasked.

Hi Steve,

have you renamed all NVDIDRV.SYS to *.SYX? If not, do it then install/activate
Nova again and it will work, promise.

You'll find the drivers in your gemsys folder and should look like this
when you're ready to roll.
C:\gemsys\nvdidrv1.syx
C:\gemsys\nvdidrv2.syx
C:\gemsys\nvdidrv4.syx
C:\gemsys\nvdidrv8.syx
C:\gemsys\nvdidrvh.syx

greetings, janne

I have almost every Atari ST magazine published from 1985 to early-90's. Don't have an ST anymore. If anybody wants these magazines you are welcome to have them FREE. Otherwise, I will be throwing them out. Magazines include: STart, ST Log, Analog Computing, Compute's Atari ST and others. Well over 100 issues. All in perfect shape...many in mylar bags.

They are much too heavy to ship at a reasonable price, so if you live in the Philadelphia, PA area you can either pick them up or I will **deliver** them to you (reasonable distance).

Contact me at...TVTEK29@AOL.COM if you are interested. After October 31st they are in the trash.

Oh, I also have a lot of ST software you can have for Free as well. Let me know if you're interested and I can send you a list. I can ship these to you if you pay postage.

Jim

Thank GOD. I could never get that program to restore. It worked fine for backup and verify, it just never restored for me! (Falcon, Wangdat DDS).

Claes,

There may be an option, though I haven't tried it. Their are boxes that not only will allow sync to MID but also provide a SPDIF digital signal output to clock the audio. Thus, theoretically, the sampe SMPTE signal that is causing fluctuations in the MTC is causing fluctuations in the sample rate via SPDIF.

Again, I haven't tried it, so I don't know that it CAN'T be done.. it's possible.

Bugs!? I could never get it to restore.. period! Maybe once in a while, but not consistently.. I would backup and verify, everything appeared fine.. but the logfiles weren't found, or the restore wouldn't work, etc. FYI, I have a Falcon, 3 gigs of external HDs, and a Wangdat 3100 DDS drive.

Just make it work, that's all!!

I have a Brother 630 laser printer and it needs no special drivers, it plugs right into the printer port just like any DMP type printer. This only only has 1/2 meg of ram so I can only get up to a 5x5 picture printout before getting the out of ram error, but it does way better than any DMP I've had hooked up. Plus while it's on my TT at this time, I had planed to use it on my Falcon, as unlike the Atari lasers, it just uses the normal printer port on the falcon. I was able to test it there and it worked just fine. So far, I've printed 4 reams of paper with mine.

Oh, BTW, I paid $8.00 for it at a yard sale!

Works fine here, with MagiC 5.11 and Nemesis (I have to use a printer
spooler with that on high).

The two bomb report does ring a bell - I found this problem when trying to
print after previously having changed resolutions where a replacement MagiC
shutdown program hadn't properly shut the system down.

The clicking noise is probably the power supply protecting itself against a severe overload by switching itself off - when it comes back on line and finds the same fault condition it repeats the cycle.

>> Hmm .. not an experiment to do too often. It sounds as though the IDE
>> is causing a big current drain on the PSU which is even pulling down
>> the 5v supply (power light). You must check the IDE drive itself and
>> the cabling to it.

I'd probably disconnect the IDE ribbon from the motherboard to isolate it as completely as possible, same with the fan (I think this is on a small socket plugged into the motherboard?)

Another plan would be disconnecting the PSU from the motherboard to check that it still operates properly - you may need to supply a load such as a bulb (a 21W car bulb on the 5V line would probably be about right) in order to make the power supply start up.

>I think the dim flickering is some kind of indication from the BIOS that
>it filed to complete the boot sequence. (Could be wrong though).

My floppy light flickers dimly all the time, I thought that it was part of the media change routine.

I doubt that it's the same flickering that Dennis describes tho'.

From: derryck@TAKE.THIS.OUTcix.co.uk
Message-ID: <706qlckqj3@plutonium.compulink.co.uk>
Source record: 91872

I'm drooling over the CT2 but as I've already got a Nemesis installed in this Falcon I'm wondering just how difficult it would be to fit one - I don't really want to have to remove it so any comments from someone who has already gone this route would be welcomed.

Thanks to Robert's posting we already know that there is a need to move the internal IDE drive, but to where?

What of other matters such as printing - the Achilles heel of Nemesis, requiring a print spooler or switching to low or off to cure.

Can CT2 utilise any of the Falcon's RAM or will my 16Mb SIMM become redundant?

Any problems found?

Thanks for any answers, email's fine if you prefer.

This problem still remains.

ME

989. Q: Best image viewer for CAB 1.5

Newsgroup: comp.sys.atari.st
Date: 1998-10-16 00:00:00 UTC
From: Markus Egg <Markus.Egg@vcpc.univie.ac.at>
Message-ID: <36270BE6.84A131F3@vcpc.univie.ac.at>
Source record: 91878

Finally I got CAB working.
At the moment I only switch off the pictures to make fast testing.

But todays WWW-sites are nearly unreadable in the text mode.
It's a bit senseless with all the underlined [IMG] ;)
(e.g. at http://www.geo.de/)

Is there any good and fast viewer for the pics used mostly at
WWW sites (jpg, gif ...).
I just need a tool -possible showing the pictures at the CAB
window?- to dither the pictures in a reasonable way for my
high res SM 124.

Thanks in advance
ME

>

Markus,

an external viewer is only good for "separate piccies". The ones that people tend to use on pages to "make them look good" will still be shown by CAB, i.e. they must be decompressed, dithered etc. by CAB. CAB's not the fastest one here :-(For "external piccies" I use Graftool, which is pretty fast, but then again, I'm running TC so the program doesn't have to recalculate.

It would be nice when some people start learning how to create homepages. Instead of adding a background tile in dark green, you can set the BG color by just adding one line in the source text. Next thing would be how you get a nice page without minutes of D/L time because there are dozens of bloody pics to load which don't do a thing but make the page only fuzzy.

Look at some pages: a stupid mix of all kinda fonts, they simply don't look right at all mixed with other types and on top of that some people think you read fontsize 1 in red best on a black background... Now I'm talking COLOR here, which is hard enough, but imagine what happens when you try to look at that on a mono screen!

So in the end maybe you're just better of in text mode anyhow... :-)

995. Falcon Midi HELP

Newsgroup: comp.sys.atari.st
Date: 1998-10-16 00:00:00 UTC
From: binson@zetnet.co.uk
Message-ID: <707u67jmq1@irk.zetnet.co.uk>
Source record: 91884

Hello

Recently purchased a 4meg 030 falcon with smp2 and cubase audio.
Using this for sequencing and the "falcon direct to disk" for recording
just the vocals. I know there are hardware add ons available and
modifications that supposedly better the machine. Not having seen or
used these can anyone be of any help with the following queries.

Line Attenuators
What do these really do and how can you tell if your
system has already had them fitted.
Hardware Add ons
What is a practical use for the SPDIF hardware, ie, does
it allow you to sample CD's digitally to say use in
your own compositions.
Analogue Interfaces
Do these improve on the quality of the analogue to digital
conversion, if not what other methods is there for
improving the conversion, taking cost as a important
consideration.
Is There Anything Else
Anything you might be able to add to the previous
questions that may be of assistance to anyone trying
set up a decent Midi system on the ATARI FALCON eg -
www.sites, other Add ons.ETC

Appreciate any help
BILL

Source record: 91887
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

Is it possible to use PLIP on an Atari without installing Mint? STiK does not support it, that much I know, but does STiNG support it, or is there any other solution?

Anyone come across a PCMCIA interface solution for the ST??

I have a PCMCIA CD Rom drive and could do with the ST accessing it somehow...??

Also, I have a Plustek scanner (9636P) Parallel connection...how to use this on the ST??

Cheers

I used to have one named Toolbox and it worked just fine, but I
lost it and have never been able to find it again.

BTW, what is the max size of partition can be made using ADH? I
might be getting a 2.1 gbyte hard drive donated for my TT.

While the platters in removable media are essentially the same as in fixed drives, the unsealed system is much more prone to failure in the moment when the disk is inserted into the drive. I've been thinking lately that Syquest and Iomega should figure out some sort of counter for their warranty. xxxx ejects is much more a realistic measure of removable life than hours used or years aged. I was speaking only of Dungeon Master 2. Dungeon Master 2 and
Chaos Strikes Back are not the same thing. Dungeon Master was released
by FTL for the ST, Amiga and PC, and I think that was all. Chaos
Strikes Back was also released by FTL for the ST and the Amiga.
Dungeon Master 2 was released by Interplay for the PC only. If anyone
knows of any other ports, please, let me know.

As far as I know this does not refer to any cache belonging to
WBDAEMON but to the FAT, DIR and data caches which you have probably
set up anyway (often these are provided by the hard disc driver). It's
a bit confusing in the docs. isn't it!?

>Does it improve on disk access for me enough to even think about
>installing it?

Well, I've stuck it in/taken it out/stuck it in again ....!!! It's the
first thing I suspect if I get corrupted messages/mails but it has
NEVER turned out to be the culprit hence it is IN again now.

Can't say you really notice the difference but it's amusing to hear
the HD catching up with its 'writes' when the processor gets some
breathing space.

From: binson@zetnet.co.uk
Message-ID: <70aesenas1@irk.zetnet.co.uk>
Source record: 91699

CAB 1.5 cache
On a recent visit to the search engine AltaVista. I was
interested in getting some links to my hobbies. The search asks for
key words to type in and gives a page of 10 results plus the option to
view further set sequences of 10.
Cab 1.5 saved them to cache with the usual numbered sequence, for
instance say, 0000171, I did notice it left off the HTM file extension.
Preferring to collect as many pages as possible then read them
offline, I found that when offline Cab would not withdraw them from
cache but would only give the alert box "host unreachable".
Also cache tool would not copy the files.The files were all
attainable by using the Cache Cab Tool and looking for the file
number, then manually getting the file from the cache.
Has it probably has something to do with the file extensions???
Bill

> I have sent the latest drivers to Steve Hammond.

Jo did send me the latest driver (v.2.67 for the Mach 32), but it does
the same thing as the drivers that Nima sent me (v.2.61 and 2.66). As
the box says a Nova Plus I am assuming that it is a Mach 32. If it were
a Mach 64 or an ET 4000 based Nova would the 32 drivers cause the same problem?

Well,I have installed it but I have not noticed any changes at
all.There is another little program called FLOCK_OK.PRG which you put
in the start folder to give background DMA floppy access.It tells you
in the manual not to use it with HDDRIVER.Does it give true
background copying and is it safe to use?

I am using an STE.

If you use something like Optimize, you don't need to. All you need to do
is edit the first character of the name to be E5 in STTools or a similar
disc editor, quit that and start up optimize and do a logical check on the
partition you just edited. If you're particularly paranoid, don't turn on
repair options the first time round. This will let you see what errors
there are without reparing them. Having said that, I've had no problems
with Optimize as yet, including when optimizing a partition.

One thing to note once you've done this, it's a good idea to do a reboot
when you quit Optimize to ensure any drive caches are refreshed properly.

He could be referring to Chaos Strikes Back, which was the follow-up to
Dungeon Master. If he is, the best thing to do is keep an eye out for
people selling software, you'll possibly find it for ~3-5UKP.

I must have been very trusting then, as I've been using it for quite a
while and didn't have any real concerns about it mucking up. Then again,
I always do a logical check, with repairs enabled, before I optimize any
of my partitions. It's never mucked up anything here and has found the
odd cross-linked clusters and let me know about them.

The other bonus of HP_OPT, or Optimize, is it's the only optimizer that
handles long/VFAT filenames without removing them.

Are you using an ST,TT or Falcon. Try the version 2.7 of CAB, it handles the graphics and tables much faster than 1.5. Cab also has an excellent monochrome mode, I think that's only in vers 2.0 and up.

There is a demo of 2.7 available.

Jan, NVDI isn't even on my computer. I did get the special version for
Nova boards and the drivers are not there. But I wanted to try and get
the latest Nova driver working before I loaded NVDI. As I mentioned, I
can get mono to work and NVDI works with either 2.61 or 2.66. The
problem is that with my board I cannot get any color resolution to work
with either of these drivers.

Thanks for the thoughts however :)

I don't know if STiNG supports PLIP yet, but IIRC it was planned.
Beware that you can't connect your Atari to a PC running PLIP, because
Linux-PLIP use some control-lines that's not available on Ataris.
Perhaps it can be done with some additional hardware.

That's not correct, NVDI 5 doesn't support Mach chipsets, only ET4000
(and perhaps 6000). NVDI 5 only supports older Nova-cards with
ET-cards, with Mach-cards you still need Nova VDI.

Hi William,

as others already suggested, we do have time zones and also a dateline.
Now, that's not all there is to it.

Computers have system clocks and these may run behind/ahead.

Another thing is how the time is passed to the mail/message headers by the
programs. First of, time refs on the Internet are based on UTC (or GMT,
the former name for it).

Sting uses a CPX, Sting Protocols, in which you can set the difference of
your local time to UTC. Over here we're 2 hrs ahead of UTC, so the setting
for "lag behind GMT" is set at minus 120 min. Gotta change that into -60
shortly, since we're switching again to wintertime.

Okami also has a line in O.INF for a timezone setting.

So does Firenews/Babel, it's the first line in the ACTIVE file.

This one was set to +1 by the author, so I set this to +2 when I
configured Firenews. The first thing I received was an e-mail from
timezone-warner@cis.ohio-state.edu, that they got a message in that
according to the time-stamp was received 4.78 hrs ahead of the actual time.
So I switched the timesetting in the active file to -2, and that was it.

I'll bet there will be lotsa messages with a wrong time-stamp shortly!

Hope this clears up a little...

CT2 use 16 or 32 EDO on this card (TT-RAM) and 4 or 14/16 Mb(ST-RAM) .
The Video RAM is the ST-RAM.

I have a probleme with my VANTAGE 2000 + 16 Mb, I use my old card 4Mb, that is well.

I stand corrected. Then Jo must be using an ET4000 card and not a Mach32.
His X-Hardware header says he's running a Mach32, though. Steve must be
running an ET4000, too, because his problems are almost identical to what
Jo experienced (i.e. the newer NOVA drivers not working correctly).

From: tesla1@zetnet.co.uk
Message-ID: <36286ba05ab060@zetnet.co.uk>
Source record: 91780

Hi All,

I know you put the WBDAEMON.PRG into the start folder to use it but how do you configure it.It tells you in the MagiC manual that it recommends reserving memory for the cache but I have not got a clue how to do it.

Does it improve on disk access for me enough to even think about installing it?

Gordon.

Hi There

Just stick it in the start folder and forget it works great it does speed
up file transfers saves etc never had any problems with it.

>>ET-cards, with Mach-cards you still need Nova VDI.
>
>I stand corrected. Then Jo must be using an ET4000 card and not a Mach32.

In fact I'm using both ... I own two TTs each one equiped with a
different graphic card : the main is Nova mach 32 equiped and the
second is Crazy Dots 15bits equiped and yes, the Crazy Dots is ET4000
based.
While installing NVDI 5, the program will ask you to select any
installed cards and yes with Nova, NVDI will switch off the screen
drivers by renaming them SYS to SYX ...
But of course you can continue to use the other NVDI functionnalities
like Speedo, TTF and now Postcript fonts and above all printing with
the latest printers drivers available on the market ... there is a
long list for them ... let's have a look at Behne and Behne web page:
http://home.t-online.de/home/ToBeHome/homepage.html

>His X-Hardware header says he's running a Mach32, though. Steve must be
>running an ET4000, too, because his problems are almost identical to what
>Jo experienced (i.e. the newer NOVA drivers not working correctly).

But with my Nova and the latest driver everything works perfectly ...
I have sent the latest drivers to Steve Hammond.

Note that the brand new NVDI 5 modifies the palette and then you can
now succeed to correctly display transparent animated GIF inside CAB
...

1052. TAF meeting October 21st - Secrets of LINUX

Newsgroup: comp.sys.atari.st
Date: 1998-10-17 00:00:00 UTC
From: dreibel@idirect.com
Message-ID: <36288e2a.0@nemo.idirect.com>
Source record: 91785
Cross-posted to: comp.sys.atari.st,comp.sys.atari.advocacy

Agenda for Toronto Atari Federation meeting, October 21st 1998:

there's a very popular operating system out there - and Atarians
can use it!

On October 21st, TAF will be hosting a night to discuss about
LINUX, the UNIX-like operating system that's been growing very popular
with the PC crowd, and has recently made the news what with Intel
recently investing in a company that distributes it. And remarkably, we
can even install versions of this on TTs, Falcons, Hades, DirecTs, etc.

We will have on hand a speaker from the Canadian LINUX club CLUE
who will discuss with us the history and advantages of using this
pre-emptive multitasking system, the software that's used with it, etc.
And hopefully we'll also have it installed on one of our computers as
well for a hands-on demonstartion, as well as other Atarians who use or
program software for LINUX.

This should be a most interesting night! See you there!

PS - November 18th is the next TAF MonSTEr Flea Market! Circle your
calendars now.....

TORONTO ATARI FEDERATION User Group meetings are held on the Third
Wednesday of the Month in the North York Memorial Community Hall on the
Lower (or Concourse) Level of the North York City Centre Library at 5110
Yonge St. at Parkhome Ave. Parking garage inside the complex. Those
using public transport can take the TTC's Yonge-University-Spadina line
to North York Centre Station. Meetings start 7:30 PM, $2.00 to
non-members. Membership is $35 CDN a year, and includes a subscription
to the club newsletter PHOENIX and full use of the TAF Online BBS. A
membership in TAF IS Atari support!

Thing has an option to unload itself when you run a program which might be
a solution for you.

Aixit should have a memory upgrade for you that could solve your problem if
your pocket is big enough, try 16/32 in the UK.

Alternatively jinnee was rumoured to use less memory than Thing so that
could be another route (I can't comment from personal experience).

>Even with AVServer installed with Magxdesk is still does not support
>all the AV-protocol functions as Thing does.Thing would have an
>advanage here.

Indeed it does, I would have like to have seen AVServer developed much
further as I still think Magxdesk has the edge in terms of speed.

Source record: 91644

Hi folks!

1) I`m looking for some harddisk for my ATARI 1040STF. Maybe You have an SH204 or something like that for sale? (ready to plug in and work)

2) I would like to upgrade my TOS (current version 1.0) to higher one, so if U have fresher TOS chipset for ATARI 1040STF, please write to me!

3) I`m interested in other ATARI stuff: such as Computer ifselfs (STE or MEGA ST2 / MEGA ST4), software etc.

Thanx, I`, waiting your mail!;-)

On 18 Oct 1998 starlord@ptw. wrote:

> Using HDX 503, what would be the biggest partation I could set
> up on a 2.1 gbyte scsi drive?

This is actually dependant mostly on the TOS version:

TOS version largest partition supported
1.xx 256 Mb
2.xx/3.xx 512 Mb
4.xx 1 Gb

This answer was provided by Uwe Seimet, so it should be accurate :)

Beware that Diamond Edge and other defraggers/optimizers freak out
if/when they find partitions bigger than 256 Mb, thus often corrupt
the data in this case.

Most partitioning utilities have an option called "TOS compatible"
that purposely uses small sectors and 256 Mb maximum partition size,
which should be used at all times, IMHO.

I guess I've been lucky. I've used a Syquest 44 meg drive for years
as well as an EZ Flyer. Nary a problem or file lost. Maybe you had
drives made on Monday!

>>> nameerf@flash.net

I'm with Mike. I don't use CAB very often because it freezes or
crashes with increasing frequency. I have the latest English version
of CAB and I've tried various OVL s. Even the ones that are supposed
to timeout don't. I have to terminate CAB via MagiC. Atari software
is still way behind when it comes to the web, and I don't really
expect that to change at this point. There simply aren't enough
developers who can afford to spend the time it takes to keep a
product viable in a constantly evolving environment like the web.
Still, if you could make CAB stop as you can with any browser
I've used on the PC or Mac, it would alleviate the frustration of
trying to surf with an Atari.

>that all of the paths show up properly there.

Thanks for the prompt reply!!!

Unfortunately, tweaking the PROFILE file isn't the problem. The problem is that MWC's MSH.PRG cannot (apparently WILL not) FIND the PROFILE -- even though it's in the same directory as MSH.PRG. I simply cannot explain this behavior. There is nothing that I can see wrong with the PROFILE file, either.

Sigh...

Yes, as I belive a 2.1gbyte scsi drive might be on it's way to
me. If so I'll be adding it into my TT, replacing the 548meg
drive with it and place the 548 into where the 130 is and save
the 130 for whenever the Falcon comes back to life.

It's been a very long time since I've worked with MWC but for some reason
I'm thinking that the PROFILE file has to be in a certain directory and
not in the same directory as MSH.PRG. Maybe a \bin directory ?

Sorry to keep taxing your memory, buuuuut....

Both MSH.PRG and PROFILE are in the d:\mwc\bin directory. I tried creating
a BIN directory on A: and on C: but that didn't do it.

Thanks again for trying! It's appreciated...

1077. Midi software and files

Newsgroup: comp.sys.atari.st
Date: 1998-10-18 00:00:00 UTC
From: ab453@cleveland.Freenet.Edu
Message-ID: <70dli7$i3n$1@alexander.INS.CWRU.Edu>
Source record: 91660

Hi!

I noticed that my church has an Ensoniq keyboard with
midi. I need help in the following:

1.) What program can I use to play Midi Files? *I have Activision's
The Music Works-will this do) Also, I have the Suzzy B CD ROM
and the midi section has a bunch of midi seq. programs,
which one can I use?

2.) Where can I get hymnal files for midi? Or church-related
midi files. The CD ROM collection has tons, but I
am not certain about any being hmnal or church-related.

I am a total newcomer to midi, other than knowing what it
means. If anyone has a collection of hmnals that
they have come up
with, I'll pay for some floppy disks (720K) to be sent to me.

ANy help in this matter will be most appreciated!

Regards,

Jim

You can use any of the versions of the Infocom text adventures if
you have a suitable interpreter program. (Called a Z-machine.) Try the
FAQ on rec.games.infocom, -it will point you to an archive that has several
Atari versions. I bought the "Lost Treasures Of Infocom" compilation for
PCs, and they worked on my ST and Falcon just fine. I've picked up some
boxed copies of Atari versions at the St shows too. (And I'm holding on to
them !)

Have Fun,
"Augeas"

The only occurance I can think of would be if Screen Eye and Expose
were on the bus together. I have never tried this setup.

>
>Also, is it necessary to put headers on the cards and stack them?

Well, your adding to the length. Mine worked with 18" of cable. I have
no way of knowing what the limit might be. Need an electronics expert
for that, but the idea is worth trying.

OK, thanks. I had actually been looking at the FAQ and the sites leading off it (and very well put together it is too; congratulations), but hadn't yet got as far as the hardware section.

Damn. Guess I'll just have to buy a new PC mouse to use with my PC, and doctor an Amiga mouse to use with my ST when it is working.

I suppose this means I can't connect an ST joystick to my PC mouse port for use with emulators then?

Oh well, never mind.

Hi Bill,

(With apologies to Trevor for chipping in, but I couldn't resist :) .)

The Veloce+ is an '020 accelerator with a 32-bit TOS 2.06 and any of:
0MB, 2MB or 4MB of 32-bit FastRAM. It's only for the STe, though :-)

It's available from TUS Developments in the UK. I'm not sure if they
have overseas distribution. Their web-site is:
http://www.tusdev.demon.co.uk/
but it's rather sparse :-(There was a review of it in Atari
Computing #10, however.

I've had mine for a few weeks now, and initial impressions are very
good. Compatibility is good, at least so far <g>. Speed is now
somehting faster than a standard Falcon, although I'm not (yet) using
NVDI which is supposed to help :)

The only downside is I'm now in hock up to my ears repaying a loan
from a friend <BG>.

HTH,
Misha

It's a replacement processor board for the STE that adds/replaces the
68000 with a 68020 running at 16MHz. It also adds upto 4Mb of fast-RAM
and TOS 2.06. It's made by The Upgrade Shop in the UK and if you want
any more info pay a visit to their web site. The URL is

If I were you, I'd leave it off. I whenI first got Magic, I turned on
background DMA and there was a large drop in speed when copying. It's
as though HDDriver was using an interupt to keep the transfers working.
As soon as I turned it off, the copying speed increased again.

>I am using an STE.

As am I. I think the STE just isn't quick enough to handle it without
a noticable slowdown. A TT, or Falcon, on the other hand shouldn't
get a noticable drop in copying speeds.

1088. PC124 Monitor

Newsgroup: comp.sys.atari.st
Date: 1998-10-18 00:00:00 UTC
From: tconrardy@hotmail.com
Message-ID: <70c7t9hsg1@news.ncal.verio.com>
Source record: 91724

hello All:

Today I saw in a used computer store, a PC124 Monitor (I think those are the numbers..not Sc1224)with a DB 9 pin.Can this be used on a TT? (or a mega Ste?) I have not seen the DB 9 pin before. My TT uses a standard 15 pin connection. What System was the PC124 used for?

Thanx ahead of time!

Tim Conrardy
TT030/Mega Ste

Source record: 91727

On 17 Oct 1998 13:06:55 , William Platt wrote:
>What is the Veloce, and how did you get more than 4 megs on an STe
>

It is an upgrade board for the STe using the Motorola 68020. It comes in 3 versions:

Veloce+
Veloce+2 2MB Fast Ram
Veloce+4 4MB Fast Ram

The Fast Ram is added as TT RAM by a small AUTO folder program. In case there are some programs that will not work in 68020 there is a toggle switch to reset to 68000. It comes with TOS 2.06.

To get a full report I suggest you get hold of Atari Computing #10 which has a 2 page article by Joe Connor plus other info by Simon Morgan.

Details available from The Upgrade Shop and there are details on their website http://www.tusdev.demon.co.uk If you're good with a soldering iron it is DIY as you're not in the UK?

I have had it installed for several months now and run it with NVDI. The waiting in CAB for file/picture formatting etc. is now minimal. I also use a 33.6k modem with modified port up from 19.2k.

Regards

Trevor

1092. FS: Atari ST 1040 STf + monitor

Newsgroup: comp.sys.atari.st
Date: 1998-10-18 00:00:00 UTC
From: miro@euronet.nl
Message-ID: <1dh3jhp.4neljf13s3vswN@p027.mas.euronet.nl>
Source record: 91728

For sale: Atari 1040 STf incl. SM124 monitor, mouse, mini-joystick. Also
included That's Write 4 (Dutch version), games and disks with shareware.
Attention, this model has no RF-outlet, so it cannot be connected to the
antenna of a tv-set. However, I add a scart-cable, so it can be
connected to a video-in connector of a tv or videorecorder.
Price: 150 Dutch guilders (Euro 70,-)
Please reply by mail for further details.

1095. DFW Atari Show

Newsgroup: comp.sys.atari.st
Date: 1998-10-18 00:00:00 UTC
From: Sam Casas <scasas@ix.netcom.com>
Message-ID: <70crod$hi3@sjx-ixn3.ix.netcom.com>
Source record: 91731

DEUCE 98
The Atari Users of North Texas (AUNT) Computer Exposition will be coming again to
Dallas this November in conjunction with the monthly DFW XChange Super Saturday
activities at the beautiful Dallas Infomart. Show date is planned for Saturday the
14th. As with the last three DEUCE shows, the actual show date will be finalized
120 days prior to the exposition. The exposition, along with the Super Saturday
activities, charge no admission fees and are open to the general public. The one day
exposition is planned to begin at 8:30 AM and run until 4:00 PM. A Friday evening
pre-show get together and a post show get together are also being planned.
November is still a great time to visit the Dallas Metroplex. The DFW XChange Super
Saturday activities are a monthly computer extravaganza where thousands of computer
enthusiasts get together, share their computer interests and enjoy some of the best
computer and high-tech electronic buys in Texas. This November will again be special
for us Atarians because so many of our finest developers and dealers will be partici-
pating in the activities.
The Dallas Infomart facility, a replica of the famous 1895 World Fair Crystal Palace,
is located in the heart of the Dallas commerce district at 1950 Stemmons Freeway
(Interstate 35E). The facility is leased by the DFW XChange each month to provide
a community service to all computer users in the Dallas-Ft Worth Metroplex area. The
Atari Users of North Texas is one of many participating user groups that help support
this community service by sharing our Atari computer interests, general computer
expertise and providing user assistance to our local Atarians and the interested
general public.
Vendors are being lined up. Systems for Tomorrow, chroMagic, Crawly Crypt Corp and

Emmulators have already confirmed their participation in the show. Vendors interested in participating can contact David Acklam at (972) 242-9655 or via email at
d.acklam@genie.com. You can also visit the AUNT internet home page at http://www.startext.net/homes/aunt.

Tim, Atari once dabbled with PC clones hence the PC124. It could be persuaded to work with ST/TT/Falcon for mono modes only but you will need to make up a lead. It may be Atari branded but it is essentially a PC monitor.

Yes, that is a bit sad. How about connecting it to an Amiga? I believe it has
got the same incompatibility issue with Linux PLIP.

From: ALF <ethernyet@aol.com>
Message-ID: <70d6foqg1@supernews.com>
Source record: 91736

Hey, everyone.

I've been trying to get MWC to work on my 1040ST and am running out of luck. Nothing in the documentation offers any help on the subject.

The bug is that when I run MSH.PRG (The MW C Shell), it's supposed to read a file called "PROFILE" in the same directory to configure itself. Well, that's not happening on my Hard Disk installation of MWC. It works when I just off the Supra 30MB hard disk and boot from the MWC floppies, but I really don't want to to compiles from floppy...

I can't figure out if it's some magical problem with MWC and hard disks, or if there's something in the Supra HD drivers that's freaking out MSH. I've even tried changing the extension on MWC.PRG to MWC.TTP so I could try to give it "PROFILE" as some sort of parameter. No luck their either. I guess I could try to disassemble MSH, but SHEESH isn't that going a bit far? I wonder if MWC souce code is available on the net somewhere?

Anyway, if anyone out there has a suggestion or two, it would be most appreciated!

ALF

I don't know anything about PLIP on Amiga. However, it should be
possible to design some simple hardware and/or use some additional
lines on the Atari to get Atari<->Linux-PLIP working. It would most
likely need a new PLIP-implementation on the Atari though.

Hi,

Does anybody have the software that came with this HD recorder.

It came out in '91 for the Atari & was designed to run along side
Cubase/Notator SL.

It also gave away a software program with it & it's this I'm
particularly interested in.

Your help would be greatly appreciated.

Although it's been many many years since I used MWC, I don't recall ever having a problem running it on a 1040ST with my Supra 30 mb HD. I used it that way for many years until I converted to a TT and Lattice C. I also used MWC heavily on my Stacy laptop computer without a problem.

I do recall initially that I had some problems getting everything just right in my PROFILE file as well - I believe you can tweak that file manually. Make sure that all of the paths show up properly there.

I wish I could be of more help - old brain cells, ya know.

From: drojo@marlin.utmb.edu
Message-ID: <70eers$2ov$1@allele.utmb.edu>
Source record: 91595

Hi Gordon.
WBDAEMON is hardly noticed when working with a hard drive, because
the data transfer is fast, but accessing floppies the thing shows its
usefullness, as the busy bee turns off when the drive is still working.
The feeling is of a much faster write access, because part of the write is
done in the background. In my falcon it reserves about 300K, that its
right, as saves time and is low risk of loosing data in the case of a
power faiil, but would be nice to be able to configure it tough.
FLOCK_OK.PRG is recommended when there is no true background DMA
trasnfers available, and what it does is (IIRC) to lock the floppy when
this and the HD are used at the same time (both uses the DMA channel), and
continues after that. This way the background floppy access can be
activated without risk of data corruption. When HDDRIVER is installed,
true background DMA can be performed and no device is locked. This is
very nice for true multitasking as the control is returned to the user
during the disk access. I used it until got HDDRIVER, and had no problems
at all, but if the background DMA flag is activated without HDDRIVER or
FLOCK_OK.PRG, the fatidic "device is not receiving data" can show up, and
data can be lost.

Regards.

Daniel.

Hi guys!

I`m searching for HD for my Atari 1040STF. Also I would like to buy a complete Atari comoputer - STE or Mega STE with MORE than 1 MB RAM and optional harddrive + TOS biger than I have (1.0 :-()

If U have some software too, please let me know!

wish u the best:-)
Girts

: I don't believe you will succeed in getting the Scanner to work
: with an original ST. I am not 100% sure, but I think the Parallel
: port is NOT truley Bidirectional.

The parallel port is in fact bidirectional. However some control signals present in PC parallel ports are unimplemented in the Atari ports. The Falcon implements a couple more signals than the earlier Atari machines, but still not all of them.

This is the reason why many parallel-port peripherals can't be used on the Atari machines.

I understand the new Milan computer has a more normal parallel port, though.

Also it would be easy enough to add a new parallel port to the ST with all the missing signals, but there would be no software to support it... unless, perhaps, it could be made Milan-compatible?

Just in case anyone is having the same printing problems, I ran PFM under Multitos and suddenly everthing worked fine. Printed on the DJ500 even using Epson FX PCD file. Okay with videlity 800x600, NVDI 2.5 etc

But why no joy under single TOS? 14meg ram maybe? Thanks to Derryck from Cheshunt Comp Club for clue about running OK under MaGIc

I am rather astonished about this memory wasting behaviour.
I implemented the icon assignment in Magxdesk in such way
that only used icons are loaded into memory. Manfred also
thought that this was the best method and copied Magxdesk's
method when creating Jinnee (ASH sells Jinnee as a successor
for Ease)..

I use an "old" 105 MB drive (3,5"). So far it has been very reliable.
Perhaps newer drives with more capacity are less reliable.

I have a MIDI patch librarian desktop accessory for my Atari ST.
It's written by Keynote Software and it's called Chameleon.
I can't get it to work on a TT.

Can anyone please help me...
Why won't it work?
Is there a way to fix it?
Do Keynote Software still exist?
Is there a TT version of Chameleon?
Is there an ST version more recent than 1989 that might run on a TT?

Many thanks for any suggestions,
Tim.

> As am I. I think the STE just isn't quick enough to handle it without
> a noticable slowdown. A TT, or Falcon, on the other hand shouldn't
> get a noticable drop in copying speeds.

Exactly. Background DMA on a TT always works with no speed loss
on floppies and hard disks. Some people report speed loss on a Falcon
when accessing HD floppy disks. The reason for this behaviour is the
interrupt response time of the system. After every DMA transfer the
DMA chip causes an interrupt which wakes up the waiting task. This
task then does the next DMA transfer. On some machines this interrupt
runs too slowly.
Additionally, some people reported problems with Background DMA on
their Falcon (system freezes or crashes). This is always a hardware problem.
Background DMA in combination with WBDAEMON usually works great
(I recommend HDDRIVER) and causes a huge speed up e.g. when copying
lots of small files. I usually use about 50 kb (not MB) of disk cache. Keep
in mind that FAT cache is much more important than data cache.

FLOCK_OK is only needed for old hard disk drivers (AHDI, ...).

MagicMac uses the MacOS's "alias manager" when accessing a HFS file system,
i.e. a Mac partition.
MagicPC cannot work with symbolic links when accessing a Windows file
system, because M$ does not know anything about symbolic links. But, of course,
MagicPC (as MagicAtari and MagicMac) work with symbolic links when
accessing Atari disks or floppies or (in MagicPC) drive containers.

Message-ID: <01bdfb76$a65d7fa0$LocalHost@chappel>
Source record: 91610

I've recently repaired my good old Portfolio. But the FT.COM (File Transfer Program, through the optionnal parallel port) just doesn't work on my Office PC (Cyrix P166 CPU). It works neither under Win95, nor under MS-DOS. I tried with a SPP, EPP or ECP configured parallel port : it doesn't work anyway.

What's up Doc ?

Help !

Note : The PF parallel port works quite fine, since I can print. The PC parallel port works as well (same justification). So the problem must lie around FT.COM itself.

1125. Sick Atari ST

Newsgroup: comp.sys.atari.st

From: glennwilson@my-dejanews.com
Message-ID: <70ftj2$k4f$1@nnrp1.dejanews.com>
Source record: 91611

Hello, I am looking at the reality that my beloved 1986 Atari ST 1040 has possibly died... When it boots up all looks well until you touch a key. THEN you get one or more alphanumeric characters (including special characters) instead of the key you touched. Anyone encounter this before? I live an ST desert (Saint Louis) and would like some idea whether this is fixable before I ship it off to either coast only to find out it is 'dead'.

If you have encountered this or are more techincally inclined than I am and have an idea as to what has happened, drop me an E-Mail at "wilsong@nima.mil" please. If it is as I fear, I will be selling off software and peripherals... My wife wants to get rid of the 'dead' ST and but a MAC like the kids use at school (despite the abominable way Apple treated her years ago in supporting the IIE/IIC/IIGS market.) I'd rather, if we can't get it fixed, upgrade our IBM at home... [I can't believe I said that].

Hopefully, I will hear from some of you with helpful answers.

Thanks.

Ok, so using HDX 502 on a 2.1gbyte would not work to well, as
you say it doesn't work on anything over 1gbyte. So How about the
ICD software? I could place the drive in the box that has my
130meg scsi and runit via the iCD host I have.

I now installed it and have noticed when I had to copy some files for
my girlfriend from drive A to drive B I did have some improvement in
speed.I was a little bit worried of using WBDAEMON as I have lost
data with other disk caches.It would be nice if a later version of
WBDAEMON would allow for it to be configured.I am not too sure
whether it is still being developed.

Again,Data loss had stopped me using FLOCK_OK.PRG but I installed in
and used in conjunction with WBDAEMON works well.When I was copying
disks I could still load in other applications and use them.It did
slow things down quite a bit but it was still usable.You probably
would not notice this slow down if you are using a TT.Thanks for
going into so much detail,you have been a great help.

Hi,

I have a listing of TOS error messages.
I am not sure where I got it from though.

Message No. 36 means access denied

Thats all I have on it.

Hope you solve it.

Actually I have a mouse interface available that lets you connect a serial
mouse on the Atari. I intend to make it switchable for the Amiga as well,
but I don't have an Amiga at the moment. However you could do this
yourself by just swapping two wires, I believe.

See my WWW page for some more information about the unit.

> >

Tell me, how well did Frogger 3D do? :) Certainly not too well over here as far as I can tell. Mind you, the centipede one does look a little better. But instead of that, try Gremlin's website and take a gander at their update of Buggy Boy, now simply called "Buggy" for the Politically Correct generation. They're being so cool about it that the connection isn't being mentioned - I guess they feel they don't need the "wow-its-an-old-classic-game" hysteria to help it along. But anyone who has played the original will recognise it straight away.. gates? sequenced power-up flags? easy.

>
> Have a look at http://www.atari-centipede.com, there are few screenshots

>used these can anyone be of any help with the following queries.

First of all, please take a look on my homepage where some things are described and there are several links to the manufacturers of the equipment too...

>Line Attenuators
> What do these really do and how can you tell if your
> system has already had them fitted.

If you can record from a regular tape recorder without having to set the volume extremely low, you probably have the line level modification done. The original Falcon has a bass boost which is very annoying when you're a musician - this bass-boost is normally removed when doing the other modifications. You'll find info on how to make the modifications on my page, troubleshhoting section.

>Hardware Add ons
> What is a practical use for the SPDIF hardware, ie, does
> it allow you to sample CD's digitally to say use in
> your own compositions.

It gives you possibility to connect the Falcon to most digital units, like DAT, MD, DCC, CD etc. and you can record whatever is on the source into Cubase Audio or other HD-recording programs, as well as recording from the Falcon to a DAT-recorder or similar...

>Analogue Interfaces
> Do these improve on the quality of the analogue to digital
> conversion, if not what other methods is there for
> improving the conversion, taking cost as a important
> consideration.

They improve the analog side extremely much. The Falcon has rather poor converters and other audio circuitry, so I'd recommend you to buy external boxes for this... Check out Line Audio Design's FAD and JAM boxes, or SoundPool's FA-4/8 boxes.

>Is There Anything Else
> Anything you might be able to add to the previous
> questions that may be of assistance to anyone trying
> set up a decent Midi system on the ATARI FALCON eg -
> www.sites, other Add ons.ETC

Get a CD-recorder and use SoundPool's CDRecorder software to make your own master CD's - you can even copy your sampler's harddisk to CD if you want to...

Just as a sidenote...

I believe Aminet has details on how to convert an Atari mouse to Amiga by swapping two wires. Just apply the reverse to change an Amiga mouse to an Atari mouse.

The new Amiga mice I've seen have a setting for Atari also, which may be worth checking out.

Regards,

Clockmeister.

Hi friends:

A while ago there was a demo called mouse.prg (mouse.lzh) it is a prg and avr combination that plays animated video and stereo audio at 50khz very smoothly. My question is.

How was this made? I would like to be able to put audio and video into something like that.

is there a GEM prg that will make a prg like mouse demo from a fli file and an avr file?

Thanks.

Raymond

And as I just re-read his previous email about this, I need to
correct my statement:

1.04/1.06/2.xx/3.xx 256 Mb

Yes, 512 Mb is recognized since TOS 1.04! ;-) However, beware
of those damn defraggers/optimizers that only know 256 Mb!!!!

Note: the above figures are confirmed in the Atari Compendium.

Right, I think that information is correct, however, I have an Epson
1200C and am able to use GT Look over the parallel port..... I would
guess that whatever lines necessary are there, in that instance
(GT Look and that model scanner).

Hi!!!

I would like to help my church out by connecting a 1040STf
to a midi keyboard they have. A couple of
questions:

1.) What is the program to use to play midi files? I
have the Suzzy B CD ROM and the midi section does have
several MIDI seq. programms, which one should I
use?

2.) Anyone have any hmnal or church-related midi
files? (oops-that should read hymnals)

I am a total newcomer at MIDI, so any help
would be greatly appreciated.

Regards,

Jim

> What do these really do and how can you tell if your
> system has already had them fitted.

The Falcon's original audio ports are microphone in and headphone out (with a dreaded bass boost on the out). The usual modification is to put change the input to line level and remove the bass boost on the output. While you're at it, you should change the connectors to RCA jacks.

If you put connect the mic input to a line level output, you might overload it. Even when recording vocals, it's always better to have some sort of preamplification (a cheap mixer will do) to bring the output to line level.

There are instructions on these modifications, but they require skills in soldering SMD components, so must be performed by someone with this sort of experience.

A line attenuator is for when you haven't done the audio modifications. It's just a cable with 220kOhm resistors in line to bring the line level down to mic level.

> Hardware Add ons
> What is a practical use for the SPDIF hardware, ie, does
> it allow you to sample CD's digitally to say use in
> your own compositions.

Yes, or any digital sound source. It also allows DAT mastering.

> Analogue Interfaces
> Do these improve on the quality of the analogue to digital
> conversion, if not what other methods is there for
> improving the conversion, taking cost as a important
> consideration.

If cost is a consideration, then avoid these and perform the line level modification. They are pretty expensive, but they often offer several

audio outs, like 2in/8out. This is useful if you want to mix the tracks
on a an external mixer.

> Is There Anything Else
> Anything you might be able to add to the previous
> questions that may be of assistance to anyone trying
> set up a decent Midi system on the ATARI FALCON eg -
> www.sites, other Add ons.ETC

The other important modification is the SCSI clock patch, which involves
adding an extra chip to solve problems with SCSI timing intensive
applications (such as Cubase Audio).

*This is my 3rd posting of this message. I posted it once, then retrieved the newsgroup, and saw that it WAS there. The next day, I got the newsgroup again, and it was GONE. So I posted it a 2nd time, quit the program, restarted, logged onto the newsgroup and saw that is WAS there again. The next day, I got the newsgroups and my subject title WAS there , but when I checked it's content, it was a DIFFERENT message from someone else! What's going on here?? Did a computer bug eat my posting? Did a Falcon fly off with it? If it's STILL there (just not available on my server), my apologies for double (or triple?) posting. Anyway, here it is again:
(If this doesn't work I give up!) :-/

Hi Will,

Try going to Claes Holmerup's page. Lots of very useful Falcon/ midi info there. Once you've read all that, you can post more questions to the newsgroup to help fill any gaps his pages don't cover well enough for you. We're lucky to have individuals like Claes willing to be so helpful.

http://home5.swipnet.se/~w-51781 (Claes Holmerup)

And here are a few more you may find helpful:

http://www.lineaudio.se/index.htm (Line Audio, Atari Falcon digital)

http://ourworld.compuserve.com/homepages/titanweb/menu_ttn.htm (Titan Designs)

http://wwwperso.hol.fr/~nbales/quickfaq.htm (The Atari ST Quick FAQ)

http://www.soundpool.de/index.htm (SoundPool)

http://www.rhein-main.de/people/robert/homepaee.htm (DO-IT-F030)

Hope that helps,

Hi!

Now it's time again for a new MyMAIL version (0.70)

This time there is lots of bugfixes.

New is the possibilities to add sound to some events
you only need GEMjing installed.

Go to my homepage and download now.

Best Regards

Erik Hall

I a used computer store. Most pre-VGA colour computer screens used an
RGB connection. Look at Atari SC screens or Amiga/C64/Amstrad/MSX
whatever. You'll probably need to figure out how to make up a cable
though.

If your TV has a Peritel/SCART connector, then it has RGB inputs. The
following site has description of just about any connector possible:

http://margo.student.utwente.nl/stefan/hwb/menu_Connector.html#Video

It probably means that either the disk has gone bad or your file is
corrupted. Try copying the file over to another disk, but there's no
guarantee it will work.

It could also mean that the program won't run on a TT.

If it was a download, try downloading it again.

ADH? You probably mean AHDI? AHDI doesn't support SCSI drives with a
capacity of more than 1 GByte. You can't access sectors beyond the 1
GByte limit.
The maximum partition size depends on the TOS version. For the TT it's
512 MByte per partition. When running Big-DOS, MagiC or FreeMiNT 1.15.0
TOS compatible partitions can be up to 1 GByte in size.

It's not the only one. DISKUS also optimizes VFAT partitions without
affecting the long filenames.

starlord@ptw. com (Slc.Dennis Bishop) wrote:

> Using HDX 503, what would be the biggest partation I could set
> up on a 2.1 gbyte scsi drive?

The maximum partition size depends on the TOS version. With TOS 4.0x
it's 1 GByte, with TOS 2.0x/3.0x it's 512 MByte, with even older
versions it's 256 MByte.
Note that you can't use HDX for SCSI drives larger than 1 GByte. The
hard disk code of AHDI/HDX isn't able to access sectors beyong this
limit on SCSI drives. So if you want to use a large SCSI hard disk drive
you have to use another driver, e. g. HDDRIVER.

If you don't use an old version of TOS you should not use these
compatibility options. Compatibility, especially if it's not needed,
usually leads to disadvantages.

So there are no limitations here.....!?!?

a> MagicPC cannot work with symbolic links when accessing a Windows file
a> system, because M$ does not know anything about symbolic links. But, of
a> course, MagicPC (as MagicAtari and MagicMac) work with symbolic links
a> when accessing Atari disks or floppies or (in MagicPC) drive
a> containers.

On a PC you must then choose, to have slinks or not, and with them you cannot
have access from Windows, still not optimal, let's tell me about performance,
what is faster, windows filesystem, Atari drive, or container ?

One big advantage of accessing the filesystem from windows is that you can
then use archivers, backuo programs, transfer, network and even more
important: a disk utility program like Norton !

Why not try CBHD v5.02? It's a modern freeware driver so you should
not have any problems with recent drives. It's quicker than ICD.

Basically, you can use any MIDI sequencer or player program, as long as you don't have to modify the files in any way; so even the old Activision thing should work (I remember using it a looong time ago, but can't recall this far...).

The problem that will arise is the assignment of the sounds. MIDI assumes that you give every instrument a "program number", ie. if you select sound No.1 from your synth, you will hear a grand piano sound. Now, if the author of the MIDI file has assigned sound No. 1 to be a harmonica, the resulting music is not so pleasant anymore -ouch-.

If we talk about modern systems and new files, this is no longer a problem, as everyone will assume the use of the General MIDI standard, which defines the first 128 sound timbres to be the same on all instruments. You can test this by loading a MIDI file and playing it with any of your available players, and if it doesn't sound horrible you're probably OK. If you only hear a cacophony of bells and whistles, the sounds of the file don't match with your synth and you have to do some reprogramming of the sounds in the sequencer program.

As there are a zillion MIDI players/sequencers available, you should just test some and see what works for you. Not so tough as it sounds!

> 2.) Where can I get hymnal files for midi? Or church-related
> midi files. The CD ROM collection has tons, but I
> am not certain about any being hmnal or church-related.

Just play them all through and listen :-)

Seriously, try
http://www.filecity.com/midi/christian (ee..it was a Christian church?)
http://www.midiworld.com
http://www.midifarm.com

If this is not enough, go to Altavista and use "midi files" as search.
You'll get some 92 000 entries to check -tee hee-

> I am a total newcomer to midi, other than knowing what it
> means.

If you have any spare time, go and check Altavista with keyword "midi".
You will find megatons of information, if you are willing to learn.

I decided to get rid of MiNT, because it didn't work together well with some crucial software I use. So I started using plain old TOS again.

But now a new problem appeared: the Drvin and Scc programs do not work anymore. My computer gets stuck while booting. Anyone having the same problems, or even better, has a solution?

My system: Mega STE 4MB, TOS 2.06

Greetings,
Kees Wiebering

>
You don't need any special program, just one of the original Atari versions. If I remember right, the Infocom games have two files, the "engine" (which is usually named as what the box says, eg. "Zork.prg") and the data required (was it game.dat? I'm not sure, have to check my 10+ collection, somewhere in my treasure cove...). Anyway, I have played some PC versions by copying the data file and an Atari .prg file in the same folder. Then you can start your, say, Zork.prg and it uses the PC data file included. I believe that the .prg file is always the same, so it doesn't matter which one you use.

Some Infocoms are, however, a pain/impossible to play without the whole package. Leather Goddesses definitely needs the map included and Suspended is difficult enough even with the map... How was this solved in the PC compilation? Guess I'll have to buy it, when I now started to recall how good these games were. They don't do games like that anymore...

>you have to use another driver, e. g. HDDRIVER.
>
Well the drive came today, in a 2ft sq box! Whew! for something
that's not much bigger than my check book. And since I don't have
HDDRIVER, I pluged it into where the 130 was and ran the ICD
software, after formatting, it wanted to partition it into
something like 65 33.5meg partitions! HaHaHa. So I set it up for
4 partitions of 500 megs and one at 205.87 megs. Now they are
marked as BMG or something like that, I noticed that as soon as
it went over the 33.5 megs setting it was marked that way.

Only I can't use the ICE utly program, says something about using
6.5.3 or above, yet Isee it say 6.5.5 on bootup.

From: shimh@clpgh.org
Message-ID: <70i5pqirq1@nnrp1.dejanews.com>
Source record: 91554

I'm trying to output a monitor signal from the video out on my 1040 STe.
I trying to do this as an alternative to buying a color monitor and to run
an animation program that requires a color monitor. I send the appropriate rca
cable into my VCR video input but get no signal. Does the ST require a
monitor to be connected at the same time? If so can I use a mono one?
Please reply to this account. Thanks in advance.

There's been a compilation of 30 of these games just released in the UK
by Activision. Sells for just over ï¿½10 IIRC. Unfortunately doesn't
include HHGTTG, but as I've got the ST version I can handle that.

Which port are you using ? Has your STE got an RF Modulator output (RCA
jack)? If so, you should connect it to your TV (or VCR) through the
antenna connector, and then tune to the band on which the ST is
displaying. That's how it used to work on my old C64.

Otherwise, if your VCR has a SCART or RGB connector, then you should use
that instead because the signal is much better. You would need to build
an RGB cable to do so. Check out the Quick FAQ for pinouts and stuff.

Cheers,
Nick

My machine has TOS 4.01, 4Mb of RAM and is connected to a
basic VGA monitor. Oids runs without any problem. It loads
and runs directly from power on, backward is not required,
it even switches to ST LOW resolution by itself.

It may be that there are different versions of Oids. I have
the version which was distributed by Mirrorsoft in the UK.

I don't think so. I think FTL use fearsome copy protection
which makes HD installation very difficult. In addition, the
data is highly compressed so even if it were placed on a HD
there would still be a delay when going from one level to
another.

I'm still confused. My STe has the RF Modulator video out, and I'm doing
exactly what you described above, but what do you mean my tune to the band on
which the ST is displaying? I'm using a regular (newer) VCR and never had
to tune in to a specific channel.

well actually CyberCube were/are based in Toronto, which, you may or may not know, is in Ontario, Canada. They also made the CaTTamaran, CyReL mouse master, colour CPX, lots of good stuff. But I think they are no longer in Atari business, so any cards will have to be second hand I think. No more web page either I think, but you could do a search for CyberCube or CyReL.

Whitchurch is a bit far for me... are you going to have one in Alton
again soon?? I would have come last time if I'd known about BEFORE the
(non) event took place...

I got this box about 5 x 2 x 2 inches, it says SGS NET on the label,
with a light in the middle labeled "Activity", and a coaxial port on
either side, and to midi wire connectors out the back.
What is it, and how can I find more information about it?

If there's an FCC ID number on it anywhere, you can look it up at
http://www.sbsdirect.com/fccenter.html

With the two coax connectors, it might be a 10Mbps/MIDI interface. Just
guessing.

From: pak@conan.ids.net
Message-ID: <70isl3$if4$1@paperboy.ids.net>
Source record: 91581

Anyone know where I can get a good manpager that works on medium res?
The one that came with the nroff I downloaded only works on high res
monitors. I used to have one before my hard drive crashed a while back, but
now I can't find it anywhere.

Also, if anyone knows where I can get a non-demo TurboST, I'd appreciate that
info as well, cuz I lost that too.

My machine, if you care, is a 1mb 1040stfm w/TOS 1.2

Cheers-

```
The Atari Computing Convention: ACC '98 Show Info Bulletin 9
============================================================================

*** Please spread this bulletin anywhere you like! ***

First of all thanks to everyone who returned the survey forms in Atari
Computing issue 8. The majority of respondents wanted an Autumn show in
Birmingham and with that in mind we're delighted to announce the Atari
Computing Convention "ACC '98" will take place on Saturday November
14th 1998 at Bingley Hall, Staffordshire Showground, Stafford from 10am
to 4pm.

The Showground is easily accessible by car from junctions 13 and 14 on
the M6 just north of Birmingham with ample free parking and they'll be
a shuttle bus service running from Stafford railway station.

Tickets will cost less than ever before - just £3 on the door with £1
further discount for Atari Computing subscribers, children, OAPs, UB40,
students and orange card holders.

Here's the current line up:

* Atari Computing
Our stand will carry all available back issues, Reader Disks and Offers
and for the first time ever we will be running demonstrations and
advice clinics covering all the major aspects of computing including
MIDI/music, DTP/word processing, Comms/Internet access and Atari
emulation.

* Titan Designs
UK debut of Eclipse, a PCI adapter that enables industry standard PCI
graphic cards to be connected to the Falcon offering fast,
high-resolution, true-colour displays! Hopefully they'll also be a
chance to see a prototype of the TEMPEST 040 Falcon accelerator.
DA's Layout, Videlity and APEX Media and Nemesis will all be on display
and Titan's range of scanners, hard drives, SyQuest drives, CD-ROM
drives, Falcon 14Mb memory upgrades, cables, etc. Larger items,
monitors etc, can be ordered on the day for despatch the following
week.

* FaST Club
Will have the FaST Club CD#1 with Gemulator 4.8, Gemulator Pro
(68030/040 Apple and Atari emulation), Imagecopy, and all the other
FaST Club software.

* System Solutions
Will be showing professional audio and MIDI products. Come and meet the
```

team for advice and see CD writing in action on an ST with the recently released ExtenDOS Gold and CD Writer. Hear the fabulous sound of JAM and boost your MIDI with the MO4.
Take a look at applications running on the new MILAN TOS compatible computer complete with MINT'98 networking.
Of course we'll be bringing along the latest software including HD-Driver 7.6 and ASH's NVDI 5, CAB 2.7 and, making it's UK debut, jinnee (pronounced Genie), the ultimate replacement desktop. They'll also be show prices on hardware upgrades, modems, scanners, memory, graphics cards, large screen monitors and more!

* Electronic Cow
Squash it! v2.0 is what we're waiting to see! This brand new sample processor is aimed at creative musicians who want to do more than to just cut and paste samples makes its Worldwide debut here!
They'll also be brand new releases other their other popular products including MIDI Arpeggiator v3.0, Sound Chip Synth v3.1, Snippit Synth v2.0, Scribble Synth v1.5 (both now support STFM playback!) and EC-909 v2.0 - which also now works on STFM machines.
Existing registered E-Cow owners can upgrade to the latest releases for FREE but you must bring along your original master disks.

* The Upgrade Shop (TUS)
You've read the review of the Veloce+ in AC#10 now here's your chance to meet the designer, see it in action, and book your machine in for an upgrade - and don't forget to check out the STe IDEal interface and other hardware goodies.

* 16/32
If you're looking for gaming or Jaguar/Lynx console action place this stand at the top of your list. 16/32 are also the UK outlet for SpeedoGDOS, PixArt and some other serious applications not available anywhere else.

* FALKE Verlag/Milan Computer/Seidel Software Service
These premier German companies plan to attend and show their products directly to the UK audience for the first time.

* Floppyshop
Check out the reviews in this issue of Sounds and Stuff and the Falcon Select CD and you'll know what to expect. Their product line-up also includes Positive Image, EZ-Art Professional, Easy Stitch, Family Roots II, Power Up Plus, Tetris II, other CD-ROM titles and PDL library.

* Abingdon Synthesis Projects
Will be building CD-ROMs, hard disks and other SCSI devices into standard PC cases and connecting them to standard Atari machines using the SCSI burster expansion option.
Making its UK debut will be a Plug&Play serial mouse interface which enables any PC serial pointing device to be connected to any Atari ST/e/TT/Falcon or compatible mouse port.
ASP will also be offering a back-up service to CDR in ISO9660 format so

bring along your bare hard disk mechanisms or cased drives (copyright restrictions apply).

* ImPrint Solutions
Calamus SL 98 will be on display running on a Hades machine and under MagiC Mac running with 21" monitors.

* InterActive
For the first time ever InterActive will be accepting registrations "live" at the show and promoting the activities of the TransAction translation crew.

* CyberSTrider
CyberStrider will also be accepting registrations "live" at the show and promoting its commercial Internet services and products.

* Atari Portfolio Club
The Portfolio is Atari's solution to palmtop computing and there's an astounding range of software and extras available. Cross their palm with silver and the Portfolio Club team will look after your future!

* Roy Golding
Will be launching the 2nd edition of his book "Users Guide to the Internet for Atari", selling some promotional souvenirs and promoting the activities of the Atari Wrinklies Club and its publications.

* Stevenage & Hertfordshire Atari Group (SHAG)
Will be promoting themselves and the benefits of user groups in general. The non-profit making ST+ Fanzine will be promoted and Gordon Storey will launch Michigan Mike 2, the sequel to his award winning game.

* Coventry Atari User Group (CAUG)
Intend to bring along a range of machines including an AB040, G3 MagiC Mac, Veloce accelerated ST and more.

* Paul Jones and Matthew Bacon
If you're interested in programming here's your chance to have a chat with the Atari Computing Dynamic Duo!

* Maggie, Atari Times, All Formats Magazine, The Tyne & Wear Atari User Group, STAG (Scottish Atari Group), WAG (Wessex Atari Group), other user groups and numerous other stands.

* Sharward Promotions also run a stand where you can offer your surplus hardware and software for sale - or pick up some bargains.

There's also dozens of other stands dedicated to other platforms and technology offering general computer hardware, accessories, cables, CDs, books, satellite, telephone, radio and general electronics.

Some User Groups are organising transport and/or car shares. We'll do our best to put you in touch if you email or post us your details.

We're delighted most of the UK based companies who supported previous Atari Shows have signed up but there's still time for other exhibitors to get involved.

No doubt you're wondering how can we bring you a bigger and better Atari show than ever before and keep the prices so low, well the reason is simple. Atari Computing have decided to work together with Sharward Promotions who have organised computer shows since 1988.
ACC '98 has been combined with their twice-annual general computer and electronics show which means you effectively get two shows for less than the price of one!

We've watched Atarians drift away from recent shows because there's nothing left to do or see after several hours. We feel, after having made the effort to travel to the show, you'll enjoy the extra dimension offered by the other stands.

So in addition to checking out the latest hardware and software releases and spending some time chatting with familiar faces there will still be plenty to see with stands offering general computer hardware, accessories, cables, CDs, books, satellite, telephone, radio and general electronics.

Calling Shareware programmers and User Groups

ACC '98 is about Atarians having fun doing Atari stuff which means we want YOU to take stands, bring along your systems, show off your wares and meet your users face to face.

Non-profitmaking stand prices

A 6 foot (approx 2m) stand costs just £10.75 plus £5 for power.
An 18 foot (approx 6m) stand costs £48.00 plus £10 for power.

Commercial stand prices

An 18 foot (approx 6m) stand costs £100.00 plus £10 for power.
A 36 foot (approx 12m) stand costs £160.00 plus £10 for power.

Tables and are included BUT covering and places to mount promotional literature are NOT included so we urge everyone to start thinking about how to make your stand attractive NOW!

Contact

To reserve a stand please send me your name and address details and I'll send you a booking form:

Email: jconnor@cix.compulink.co.uk

Joe Connor
65 Mill Road, Colchester, Essex, CO4 5LJ, England

Make a day of it

ACC '98 is just one part (the best naturally ;-) of the All-formats Micro Show (AMS), now in its FOURTEENTH year at the Stafford venue. The show includes stands covering all aspects of computing and general electronics - so remember to tell your friends and bring them along too...

We're really looking forward to seeing you all at ACC '98, we'll keep you up to date with the latest developments with further bulletins.

Regards

Joe Connor

Hmm... I used Mark Williams C before I had a hard drive, but I don't
remember ever trying to run it on the hard drive later.

One thing though, if it's an early version of MWC, it might be
possible that MSH.PRG was hardcoded to look specifically on a: for
its files.

I've run into that before with early programs where the programmer
made the (bad) assumption that everyone only had a single floppy
drive, and hard coded filenames as a:\whatever.

Try running a sector editor on MSH.PRG and searching for the string
"PROFILE" and see if it's looking for a:\PROFILE.

If it is, you could edit the code in that sector (on the hard drive)
to look at d:\ (but unfortunately you can't add characters, only
substiture for the exact number that are already there, so you can't
make it be d:\mwc\bin\ unless that's how it is now).

I used to have to do this occasionally to use my second floppy drive
with programs that assumed a:\, and for my hard drive later on too.

Cross-posted to: comp.sys.atari.st,comp.sys.cbm,pdaxs.games.rpg,pl.rec.gry.rpg,comp.sys.ibm.pc.games

Software and More is a small Computer store in Citrus Heights,
California. They sell Commodore, IBM, Mac, and Apple II stuff.

A page has been setup which describes Software And More's past and
current Criminal activities.

Go see how many people they've ripped off. Go see what type of scams
they pull on you to sell you their products.

Heres a short summary:

Shrinkwrapping opened software and selling it as "NEW" (often with
manuals/disks/items missing)
Stealing computer equipment from customers
Selling goods over the 'net (receiving money, but not shipping the
product)
Pirating software still commercially sold
Extremely bad treatment of customers

So, go to the Software and More WARNING page!

Bob, you may have something there. I do seem to recall having to do something similar on an early release of MWC. It's also possible that he's just installing it incorrectly. Wasn't there an installation program, called "install.prg", or something like that, that would automatically set the proper paths, environmental variables, etc? MWC was very picky about that kind of stuff - things that normal ST users didn't have to worry about. I believe it was possible to just copy the files and such too, but using the install program made it all work.

>loaded, even if it's unfrozen.

Not sure about that. Apparently, some part of the system still
thinks it's not there.

Have you tried setting environment variable(s) for ST-Guide, e.g.:

#_ENV STGUIDE=C:\ST-GUIDE\ST-GUIDE.APP
#_ENV ST-GUIDE=C:\ST-GUIDE\ST-GUIDE.APP

It's my understanding that some programs look for STGUIDE and some
look for ST-GUIDE, so you may need both for different programs.

OTOH, if Copeq doesn't support either of those variables, then you're
probably SOL.

Thanks for the help, guys, but...

I tried it both ways - with and without using INSTALL.PRG. The version I'm running now, I used INSTALL.PRG from the v3.0 diskettes (with csd). I'm pretty sure I've installed properly. And the install program doesn't mess with the contents of the "PROFILE" file at all.

Since I'm using v3.0 I'm assuming it's not hard coded to look for a:/profile. However, to test this theory, I created an a:/bin directory and put msh.prg and PROFILE in there. Nada.

ALF

Thanks for the tip, but yes I've tried that one too... :-)

>Note: the shell will *not* fire up unless it has a valid existing
>temporary directory to use. Look at the TMP variable to check this. My
>money is on this one as the cause. ;-)
The problem is, IMHO, it's not finding the PROFILE file AT ALL. So it's not reading the value of TMP from the profile to begin with. If it were, that value is valid in my PROFILE.

>At worst the following 5 lines as a PROFILE will get the shell
>started. The compiler and the rest won't work too well but it'll

Believe it or not, if you go to the Supra site (I guess it is now
Diamond) and find the download area, the hd utils are there in the
Atari file area. I guess they thought they were comm files:).

Don't ask how I know this:).

Au contraire!

The North of Scotland has its `Dingwall', the meeting place of
the ruling body; the Isle of Man its `Tynwald', the name for its
modern Parliament: both established by the Norse, centuries ago, and
evolved from the old Norse words `thing' and `vollr', assembly field.
THING is a brilliant name for the desktop.
If only it would work for me :(

Cheers, Charles.

Lonny,

What a novel idea :). I did and guess what, you and I make at least two folks that have ET 4000 based Nova's. Now the question is if there is a different Nova driver for this board that will allow the use of NVDI 4.11r?

Thanks

Tim,

A program written in 1989 for an ST may not run on a TT. The only thing I would suggest is to install a small auto folder program called "24 bit". It limits memory access in the TT and call help with ST specific applications. If you cannot find it, e-mail me and I will send it to you.

Regards,

Steve Hammond

1230. Word Writer ST Works on a Falcon

Newsgroup: comp.sys.atari.st
Date: 1998-10-20 00:00:00 UTC
From: phantomm@kih.net
Message-ID: <70gv5b$kj8$1@dbtsvr2.dbtech.net>
Source record: 91635

I finally managed to get Word Writer ST working completely on
my 14meg Tos 4.04 Falcon using Geneva/NeoDesk!

If you are using Geneva and are having problems getting the dictionary
and spell checkers working in Word Writer ST then do this...

Install Word Writer ST fresh.

Select Geneva Tasks then select Permanent under File and set up the
Permanent Execution Flags for the Word Writer ST program. The Geneva
manual or help system has info on how to do this.
Here are the Flags I have selected...

Multitask
Limit Memory to 1024KB
Clear allocated memory
Maximize window areas
Optimize window redraws
Redraw upon exiting
Special object types
Rounded buttons
Automatic keyboard equivs
Undraw auto keyboard equivs
Aes 4.0 extended messages
Some of the other Flags may work too. Haven't tried them all yet.
Then save these settings, you may need to reboot after saving.
Word Writer ST should work fine now.

I think the key here is the Clear Allocated Memory setting.
I tried the above settings before with a 4000KB memory setting but
didn't have the Clear allocated memory selected. So one may be able
to use more than 1024KB with Word Writer ST.
Word Writer ST works fine with just Tos 1.62 on my 4meg STe and uses
all the available memory. So hopefully one can use at least 4megs
with a 14meg Falcon. Maybe more! Haven't tried it yet. 8-)

Thanks to everyone who responded with replys and sent e-mail.
And a Big Thanks to Dan Wilga of Gribnif Software for the excellent
Geneva and NeoDesk programs.

>
>Many thanks for any suggestions,
>Tim.
>.

Tim:

Here is a sugg..try turning OFF the cache, as some older ST programs WILL work if you turn it off..Music Mouse is a good example.Since it is an ACC..try renaming it to PRG, then turn the cache off. (some ACC's allow you to run it as a program)

There is a compatability problem sometimes with the TT and "older" software.

A good Patch editor that Will work on a TT is Dr T's XOR..great program! It uses the same profiles that MOTU Unisyn uses. You can download them from their web site, and remane them to what Xor will reconize them.(XOR and .HLP)

Hope this helps..I have never heard of Chameleon however.

I don't quite understand. Is this meant to be the correction? If it is,
this is wrong ;-). TOS 2.0x and 3.0x support 512 MByte per partition.

> Yes, 512 Mb is recognized since TOS 1.04! ;-) However, beware
> of those damn defraggers/optimizers that only know 256 Mb!!!!

That's a bug in these programs and you should use those that support
large partitions. The others are for the trash bin. The limit for TOS
2.0x/3.0x is 512 MByte and is not affected by some optimizers not
supporting this legal size.

That's exactly the impression I got. The 105 MB drive was fine, the 270 MB drive wasn't very reliable. For 2 1/2 years I have been using a phasechange drive for my backups and it works excellently. No problems at all, neither with the drive nor the media.

Source record: 91640

The manual for NVDI5 mentions iPRN for MagiC, is this a special version since there's no mention of MagiC in the demo version supplied with NVDI?

So far I'm impressed with NVDI5 BTW, the background printing (needs MagiC 5 or above) seems to work quite well, and PostScript font support is a nice extra that was previously only available with an optional module.

> left on caused the problem,

Yes, I had this autofire problem too.

The problem is definitely located within the keyboard/mouse/joystick
section.

I also have similar problems from time to time, usually because of those
crappy mouse connectors, but sometimes because of a bad mouse. Try
unplugging the mouse to see if that cures the problem too.

Otherwise, take the machine apart, clean up all the connections, reseat
the keyboard connector and the socketed chip on the keyboard PCB.

At worst, find someone selling a cheap/dead ST, and cannibalize the
keyboard.

Cheers,
Nick

Hi guys,

well, NVDI 5 will support ET4000, as well as Matrix TC and CX types and Nova types. As I have a 4.12 for my Matrix, there must be 4.12's for the ET4000 too... There may be problems when installing like I had: I used the Matrix software from the card manufacturer and when I tried to install NVDI it said it wasn't good enough: this turned out to "translate into" I needed the last upgrade for the Matrix software first. Wilfried Behne was kind enough to send me a copy, then NVDI installed just fine (and does a much better job than the Matrix stuff). I'm not sure whether or not the latest NVDI also supports the TC1006; the 4.12 version definitely does not.

The same may be true for Nova/ET4000 support: maybe it only installs when you've got a certain version of the drivers running already... I'm just guessing here.

Referring to the last line of your posting, in the Matrix case it's impossible to install a regular NVDI, since it needs a certain type of GDOS to run. Only solution was a special NVDI, now the new version 5 will cover them too.

Hope this helps...

Dennis,

take a note of the number of the last fetched article in the group.
Next check the number in "Default.grp", it should be one up (i.e. it shows
the next number to fetch). You may check the log, usually this contains
lines like "comp.sys.atari.st, first article xxxxx, last article xxxxx"
where you can check where the NG is at.

MyMAIL is only sending a message to gemjing with the full path of the sample
to playback.

What is your config of the system ?
I have only tested this with FreeMINT and N.AES on my Hades

>BTW: this fanfare at new mail keeps on repeating, making it HARD to click

The Knarf German MiNT Distribution (KGMD) is found on many atari ftp sites. I would suggest to you though to go to either:

yescrew.atari.org or
kellis.atari.org

for further information. Also make sure you get the KEMD Rev.2. If you run into any problems there is alot of MiNT support out there via email, newsgroups, or IRCnet channel #atari. So if it don't work perfectly the first or second time don't give up. The hassels of the installation are well worth the effort.

yescrew.atari.org has a list of the members there who offer MiNT support. Good luck!

The new Compaq PCs that we have at work have a euro symbol
on the 4 key, as well as a $ sign. There doesn't seem to be
any way of getting the euro sign on the screen though. I
suspect that new fonts are needed.

The euro sign is a sort of curved E with an extra horizontal
line through the middle. It looks a bit like a squashed
Commodore C= symbol. Perhaps C64s and Amigas already have a
usable character ?

Hi Alan,

well, not so fast: the Euro sign is sharply defined! Then, of course
Microslop had new fonts available on their homepages months ago, the bad
thing was they were all Win-95/98 selfextracters, nothing for the old OS.

I downloaded a Euro TTF font, but NVDI kept complaining about it. So even
the Microslop fonts are crappy...

Roger, I had this same stuff when I was playing with CAB: the cow saying
Mooooo! very low pitched. I recall I played the sample in Aniplayer too to
hear what it was actually like....

Well, what's running: MagiC, Thing, NVDI, Liberty, Multistrip, Calendar,
are normally on an empty desktop, then of course there may be the Dialer,
and MyMail running. Gawd, I'm forgetting ST-Guide, Menuinfo and Freedom as
ACC's, then Bubble and Popfold plus this Menu3D thing.

It is weird that after one start of Aniplayer, Gemjing gears up or down
one shift :-)

Hej Erik,

well, MagiC, Thing, NVDI plus the Liberty library are the main OS parts.
Furthermore all kinds of MagiC apps from the Start folder (Calendar,
Multistrip, Popfold, Menu3D, Bubble) and 3 ACC's: Freedom, ST-Guide and
Menuinfo.
>
>>BTW: this fanfare at new mail keeps on repeating, making it HARD to click

I'll check this one with other WAV's, but I was figuring maybe you added
an r0 command to the "New mail" section... Could it be in the WAV file
itself, a loop-command? Strange that the others simply sound once.

I'll let you know on the results. You could of course add "-r1" to all the
lines to prevent any WAV from looping...

Hi Goetz,

strange indeed. See my other message about the config, and yes, I use
Liberty (the one needed for Freedom). Like I said, it looks like Aniplayer
kicks Gemjing into 1st, 2nd or 3rd gear :-) maybe next time it shifts
into reverse... Nice going, starting up MyMail and hearing "!peempeeM" or
"!kcab eb ll'I"... :-))))))

Hey what software incompatibility problems are you having with MiNT?
If it's drvin.prg and scc.prg I have recently come across a much
better serial port driver called fserial. It's in german but very easy
to install. All you need to do is put the cpx in the cpx folder and
run the auto program before mint in the auto folder. You can get it
from my downloads page at:

http://www2.wcoil.com/~atari/download.htm

If you have any other questions feel free to email me. If HSmodem
wasn't the problem, let me know what it is and there is probably a way
around it.

Source record: 91410

OK, just experimented a little more:

So I kicked in Aniplayer a few more times, but I found no "gearshift" any longer...
Next played a WAV thru' Gemjing where John Cleese says "And now for something completely different", which is played too fast... Most of the others I tried were OK.
So I played John Cleese thru' the Aniplayer and it just sounds right...

Changed my Gemjing to a newer version (1.06 now), but no change.

Couldn't check on the loop with MyMail since I got no new mails so far :-(

Will see about that later. Maybe it's the sample I picked but the one doesn't loop in Aniplayer.... so that'll remain a question mark for now.

Must be the Y-1998 problem then :-)

The sources there are a lot newer than you're likely to find elsewhere.
I did some rather significant work on XaAES this summer.

If you intend to do any programming on XaAES, please join the mailing
list or at least get in touch with me. It would be a shame if work
was needlessly duplicated (not that anything seems to have happened
since I released beta7+).

This happened while doing a D/L of the newsgroups, while online
it looked ok, but after going offline and then re-running newsie
it showed them as a -50, haven't been able to dup it so heck if I
know what happened. Just normal luck for me.

I got a bunch of mail about the falcon, all of it making
suggestions that I can't afford at this time and for some time to
come.

I've had the same thing happen on my MagiC Falcon, using PHPLAYER
with POPwatch. Most of the time my samples play fine, but
occasionally, they'll play at a real slow speed. I can only guess
it's something mucking up the system during those times.

What about modifying the PLIP-driver under i386-linux that works the
same way as Atari-PLIP? That sounds like the easiest solution, provided
you know how to write kernel-modules. :)

Great ! Thanx Terry :)

Well, now another problem: Copeq (a French accounts software) uses
ST-Guide for its help feature but it complains that ST-Guide is not
loaded, even if it's unfrozen.

Source record: 91495

Steve,

Make it three. I have the ET4000 Nova installed inside my TT. See
following:

Hi Dan,
There are 3 types of the ET4000 cards. I will soon send you a program
that will provide you which one of the three you have, so maybe you
need to be provided a different set of drivers. I used to use the exact
ET4000 drivers that I sent you and I had no trouble in any resolution/
color depth.

Nima
homa@canada.com

I've tried to get Nima (of Homa Systems House) in Canada to send me the
promised file for some time, to no avail. I am using v2.08 of the driver
(no NVDI support) because v2.61-2.67 don't support anything greater than
16 color on my card. I believe you need v3.02 or higher of NVDI to use
it with the Nova. I have v4.11, but not the ET4000 version. It will not
work with v2.08 and only the font portion works under v2.61-2.67. I do
not know for sure if the ET4000 version will work with the Nova ET4000
or not. The menus I've seen call out about 4-6 different cards, but not
the Nova, which was a very popular card.

The Nova driver is itself a VDI, I believe, so it may be redundant with
the screen acceleration of NVDI.

Keep in touch!

Dan

There is a program called AVS. It has it's own format *.AVS. There
is a program that allows you to take *.seq animations from cyberpaint
and sequence it with samples. It was really a cool program back in
the old days. I believe it would do about 30 fps video and 25khz
audio.

I haven't been able to get the files to work on an F030. Supposedly
M-Player will play the *.seq. If I can dig it up I'll email it. It
may still be on my Jazz drive that don't work.

I believe I know someone in California with a Sunrise card, but I don't
recall the networking capabilities.

If you're interested, I could call him for you.

Get a Link from ICD. Then you can connect any SCSI drive to it.
Don't buy anything from IOMEGA because they suck.

Any STe can be upgraded with Simms. To upgrade a 1 meg STe to 4 megs
cost about $25 usd if you look throuth CS and buy mail order. The TOS
1.62 that I have in my STe seems to be the most compatable. I used it
for 8 years and never had to use a patch program, and never had a
problem with incompatability. Watch out for TOS 1.06 it's buggy. And
TOS 4.01 kinda makes you feel the machine is gonna crash any minute.

Sony never made video games and they scored a huge homerun with the Playstation. Of course Atari drove themselves into bankruptcy suing and fighting nintendo to free up the market.

The Jag wasn't a bad system and with the CD could still go head to head with the Playstation and N64 with a little backing. I believe that Atari/JTS only sold the software rights. They still own the hardware. Tom MItchell isn't an idiot, the patents on the video games were running out and it would have cost a fortune to try and renew them. With no patents, everyone and their mother would have access to the games. On the hardware side, there are still many years before the patents run out and Atari had a lot of technology that was never utilized. There were over 140 patents and intellectual property rights at the time of the JTS/Atari merger.

Don't be surprised if you see the Atari logo on some new harware in the future. Also don't be surprised if you see the C=64 badge on a new 64 bit computer.

Remember retro is in style.....

Try booting up without a mouse or joystick plugged in. I have had
headaches with a joystick stuck on auto fire. It causes random
charactars to be generated. After years of unplugging and the stress
on the mouse, there could be a short in the mouse connector.

The other problem that a bad mouse or joystick will cause is for only
half of the keyboard to work

hope this helps.

You have to get a video game switch and connect the RF out to the
antenna. You can also buy a RCA cable with bare ends from Radio Shack
and connect them to pin 2 and pin 13(gnd). This will give you a
composite signal. pin 2 is the core and 13 is the grnd. The better
the cable you buy, the better you picture will be. You will also need
male crimp connectors to make the ends so they can plug into the back
of the STe's RGB port.

There is a bit on the disk bootsector that you have to change, and
then TOS will auto matically load from the disk. My jazz drive
crapped on my and I can't get to the file that explains how to do it.
Once I dig it out, I'll send it to you.

BTW: The TOS images are not legal copies. You will probably get
flamed for d-loading TOS images.

From: "Harold R.G. Alley Jr." <ataripc@earthlink.net>
Message-ID: <362D5FEE.53B98CEC@earthlink.net>
Source record: 91505

I need help locating schematics for my CDAR 504. Up until a few months ago it functioned. Now all I get on power up are the following error codes E3, E4 and sometimes E2 on the display. At the same time the drive stops spinning. It won't function in cd audio mode either. so I know it isn't a driver problem as it used to function in audio mode disconnected from my Mega 4.
If schematics aren't available does anyone know of someone who might repair this machine?

thanks

>
>Both MSH.PRG and PROFILE are in the d:\mwc\bin directory. I tried creating
>a BIN directory on A: and on C: but that didn't do it.

There are two profiles. One is for a floppy system, the other for a
hard disk system. If memory serves it was the floppy profile that was
PROFILE by default. Have a look round for PROFILE.HD and use that as
PROFILE instead.

Note: the shell will *not* fire up unless it has a valid existing
temporary directory to use. Look at the TMP variable to check this. My
money is on this one as the cause. ;-)

At worst the following 5 lines as a PROFILE will get the shell
started. The compiler and the rest won't work too well but it'll
verify there isn't a fundamental problem ...

```
PATH=.cmd,,d:\mwc\bin
SUFF=,.prg,.ttp,.tos
TMP=d:\mwc\tmp
INCDIR=d:\mwc\include
LIBPATH=d:\mwc\lib
```

... and do ensure the folder d:\mwc\tmp has been created!

I still use MWC myself. There are one or two other issues which can
result in msh not starting properly. MagiC2 has a bug in it which
causes shell file redirections to fail and the existence of the above
environmental variables (and HOME iirc) as part of the system can be a
problem if they contain wierd data (there is a solution).

1279. TAF meeting October 21st - LINUX Night

Newsgroup: comp.sys.atari.st
Date: 1998-10-21 00:00:00 UTC
From: dreibel@idirect.com
Message-ID: <362d66c7.0@nemo.idirect.com>
Source record: 91507
Cross-posted to: comp.sys.atari.st,comp.sys.atari.advocacy

Agenda for Toronto Atari Federation meeting, October 21st 1998:

there's a very popular operating system out there - and Atarians
can use it!

On October 21st, TAF will be hosting a night to discuss about
LINUX, the UNIX-like operating system that's been growing very popular
with the PC crowd, and has recently made the news what with Intel
recently investing in a company that distributes it. And remarkably, we
can even install versions of this on TTs, Falcons, Hades, DirecTs, etc.

We will have on hand a speaker from the Canadian LINUX club CLUE
who will discuss with us the history and advantages of using this
pre-emptive multitasking system, the software that's used with it, etc.
And hopefully we'll also have it installed on one of our computers as
well for a hands-on demonstration, as well as other Atarians who use or
program software for LINUX.

This should be a most interesting night! See you there!

PS - November 18th is the next TAF MonSTEr Flea Market! Circle your
calendars now.....

TORONTO ATARI FEDERATION User Group meetings are held on the Third
Wednesday of the Month in the North York Memorial Community Hall on the
Lower (or Concourse) Level of the North York City Centre Library at 5110
Yonge St. at Parkhome Ave. Parking garage inside the complex. Those
using public transport can take the TTC's Yonge-University-Spadina line
to North York Centre Station. Meetings start 7:30 PM, $2.00 to
non-members. Membership is $35 CDN a year, and includes a subscription
to the club newsletter PHOENIX and full use of the TAF Online BBS. A
membership in TAF IS Atari support!

1280. Year 2000 Bug on Atari?

Newsgroup: comp.sys.atari.st
Date: 1998-10-21 00:00:00 UTC
From: drsace@aol.com
Message-ID: <19981021020956.14167.00002661@ng89.aol.com>
Source record: 91508

Hi there...I am just wondering if anyone knows if the Y2K bug will affect Atari's? I am wondering because since the Macintosh uses a counter and NOT a calendar for it's date, it won't be affected till 2043, but what does the Atari use? Just curious...

DRSACE@AOL.COM

1281. New release ** PH Player 4.6.1** available

Newsgroup: comp.sys.atari.st
Date: 1998-10-21 00:00:00 UTC
From: wongck@letterbox.com
Message-ID: <70juv4$gvn@usenet.pa.dec.com>
Source record: 91509

Hi fellow Atarians

PH Player 4.6.1 is ready for downloading from :

http:\\probehouse.home.ml.org
http:\\www.geocities.com\SiliconValley\6880\phsw.html

Following are features new to this release:
* New looking user interface (GUI)
* Plays direct from disk for samples
* Selectable speed & byte-format for Raw sample playback
* Commandline parameters for repeat & delay (GemJing compatible)
* Convert MIDI files about 10% faster than release 4.5
* Midi errors displayed in a window
* Midi Channel can be turned on or off
* Repeat for Midi files
* Quieter MIDI output - more audible notes
* Playing MIDI does not block GEM
* Some general bug fixes

have fun!

Regards
William

Never heard of it. Are you sure it's Atari related ? Could it be a
coaxial network adapter for the ST Midi ports ? Are you sure they are
MIDI ports ? 5 pin DIN connectors have millions of applications.

I'm not sure about newer stuff, but I remember that when I used to use
my old Commodore on a TV set through the antenna connector, I used to
have to tune to channel 21 or something to get the image. Here in Europe
we've had SCART/RGB connectors for the past 15 years at least, so that's
history for us.

Cheers,
Nick

Several people have reported CDAR drives breaking down, and I'm afraid
nobody seems to be able to repair them. Even Best Electronics can only
replace the drive.

I'm afraid it's dead.

What kind of Atari have you got ?

Most of them don't even have a battery clock. The system will happily go
beyond 2000, but some old and badly written programs will probably screw
up the dates.

This Y2K thing is really hyped up, probably by people who have some
interest in being hired to "solve the Y2K problem". People seem to think
that the world is going to come to an end. Actually it will mainly
interfere with large companies that still rely on old IBM mainframe
stuff. Your computer won't stop working because of this. It might get
some dates wrong, but, unless you do book keeping, I doubt you have any
date reliant software on your Atari.

I have to add this to the Quick FAQ.

Cheers,
Nick

Hi Nick,

you're dead right. People are making a living out of this... sometimes you
even see questions like "will my computer live into 2000?"
Perhaps people on the Win-platform are afraid their hardware will die on
this Judgement Day :-)))))

There was this Dutch Bank (won't mention names) that ran software from the
sixties for all their transactions; they had an enormous problem since all
the software programmers couldn't be located any longer/the team from the
university that developed the stuff didn't exist any longer etc.

>I have to add this to the Quick FAQ.

True. But it did not work with the install program that NVDI5 uses and
it was not possible to print from Papyrus without NVDI (or GDOS)
memory.sys. And I experienced all kinds of minor problems.

> >But now a new problem appeared: the Drvin and Scc programs do not work
> >anymore. My computer gets stuck while booting. Anyone having the same
> >problems, or even better, has a solution?
>
> What kind of other auto prg's do you use?

I actually found out that it was my SCC program. The computer got
stuck while booting with only DRVIN and SCC in the autofolder. I think
it got stuck during the initialisation of GEM. I now use DRVIN and MFP
(and ofcourse the other modem connection), but also that isn't working
satisfactory, because it doesn't work on 38400 baud.

I still don't know what's going on.

Greetings, Kees.

>What is it, and how can I find more information about it?

From STart magazine (March 1990):

Paradise Computer Systems and SGS Software have teamed up to develop the first complete networking system for the ST. SGSnet lets you share data stored on other hard drives. Up to 32 STs can be connected and tied together through one file server. This non-dedicated file server lets you run other programs and access files during networking operations with minimal reduction in speed. SGSnet utilizes the ST's MIDI ports, transferring data at 31,500 baud and is GEM and TOS compatible. Hardware installation is as simple as plugging MIDI cables into your system. Up to 500 feet of coax cabling may be used to connect to the network.

The SGSnet Starter Kit -- to network two STs -- includes server software with manual, node software with manual, two SGSnet connector boxes and six feet of coax cable. There are add-on kits for additional systems that include add-on node software with manual, a connector box and six more feet of cable.

Yesn you're right, this Euro stuff is going to be even more of a mess. I suspect that part of it is that most of the leading computer companies are american, and therefore don't give a damn about this little bunch of countries starting a new monetary system. Especially when they can make bucks out of their own market with the Y2K affair!

1299. FS: original software and books (german versions)

Newsgroup: comp.sys.atari.st
Date: 1998-10-21 00:00:00 UTC
From: Martin Haehnel <martin.haehnel@siemens.ch>
Message-ID: <362DE060.363150EF@siemens.ch>
Source record: 91527

Hi

I still have a whole bunch of original software and books (german) for the ATARI ST form the time I used to have my MEGA ST 4. Maybe someone out there is interested in this software. I do not think that the price is an issue, so we can talk about it. I would like to give away the whole bunch together, nevertheless you can get each piece separate.

Please contact me by e-mail as I do not have the time to check the news regularly.
mailto:mhaehnel@datacomm.ch or mailto:martin.haehnel@siemens.ch

BTW: As you can see in my e-mail adress. This stuff will be available in Europe.

Regards Martin

Here is the list:

Software (original disks german with german handbooks):

Optidisk secure defragmentation of harddisks
TurboST der Software Blitter software graphics accelerator
Themadat Assoziativ database
Omikron Draw! 3.0 drawing program
Leonardo ST graphics program
Signum Fonts fonts for Signum
Deja Vu
Script word processing
Wall Street Wizard
Gunship
Neodesk, Neotools another desktop for the ATARI
Voc Royal vocabulary program
Leisure Suit Larry II
Zak McKracken
Sim City
Balance of Power strategy game
RVF Honda motorcycle racing
Steel

Books for the ATARI (german):

Das grosse MEGA-ST-Buch
ATARI ST Profibuch
Der Schnelleinstieg Script II
Der Schnelleinstieg Calamus
Das grosse Calamus Buch

Scheibenkleister II Massenspeicher am Atari

Here's the marketing again. The sums that are being given as to correct
this bug are totally ridiculous. What a great way to pump money out of
stupid CEOs.

What? Does someone believe that a Wintel computer of 1998 could still be
used in 2000? No way! Both the hardware and software are totally
obsolete and useless by that time :-)

- extremely silly Python part snipped -

It seems that Microsoft has announced a patch to be used for using this
new thingie within Windoze. Also HP has plans for their printers and
keyboards, so maybe someone has thought about it after all. We'll see...
I hope that someone will produce the sign for Speedo fonts to be used
with our machines. Should not be difficult?

I think you might be right about the installation program, John...
although it's been so long since I used MWC it's hard to remember for
sure.

I used to use a screen capture program that was hard coded to save
it's snaps to a: which of course was where the disk holding the
program I was capturing pictures from had been loaded.

That was fine for a simple .PRG file that didn't take up too much room
on the disk, but for games that had the disk almost full, it didn't
work very well. Not to mention I didn't feel all that great about
writing to the original disk.

I ended up having to edit the binary code of the capture program to
point to b: and then everything worked OK.

The more I think about it, the more it feels like MWC made me jump
through some of these same hoops the first time I installed it....

Hmmm...!

A ROM TOS image loaded that way (you need the correct bootsector code, not
only set some flag) will not run. Tou need to relocate the TOS to the
correct RAM addresses.

The tospatch program can do this, IIRC.

1309. Funny things w/Gemjing

Newsgroup: comp.sys.atari.st
Date: 1998-10-21 00:00:00 UTC
From: louis@holleman.demon.nl
Message-ID: <362e26021614ccb0@holleman.demon.nl>
Source record: 91537

Hi folks,

this time for something more serious:

Just started working with MyMail 0.70 and of course I tried the options to add sound stuff thru' Gemjing.

So now on startup MyMail says "meepmeep", at quitting it shouts "I'll be back" and in case of new mail a fanfare is sounding.
(Note this will probably annoy after sometime, but it's nice to show to all the peecee suckers...)

Now the strange part: the first time I started MyMail with it, all the samples ran at half speed.

Next I did some testing with Aniplayer, and after that went back to MyMail and that time it played at normal speed.

This morning I sorted some more WAV's with Aniplayer, next worked with MyMail again and then it played at double speed...

So just to check again, I just started Aniplayer once more, played a WAV and next started up MyMail and this time it plays at right speed again...

Anyone with a clue here? I don't think Gemjing is configurable on the playing speed, but there must be something funny going on.

BTW: this fanfare at new mail keeps on repeating, making it HARD to click the "details" and next the "get mail" buttons... Erik, any chance of changing something? The meepmeep only sounds once, so does the "I'll be back" but the sound for New Mail keeps on looping...?

Who have got somes tips and cheats for Stardust on STE?
This game is wonderful but very difficult!!!

Thanks in advance...

You can answer to me in my Email : leve_fr@lemel.fr

Fred, Paris...

1311. 2.1gbyte drive TOS error

Newsgroup: comp.sys.atari.st
Date: 1998-10-21 00:00:00 UTC
From: starlord@ptw
Message-ID: <362e1fb7.0@news.ptw.com>
Source record: 91539

Well, as I had said I had formatted that big drive into 500meg sections, and while working on moving files to one section, I ran headlong into something I'id never seen before. When I reached a level of about 100 megs on the drive, I kept getting a box on screen that said something like "Not accessable TOS termaited" (I know my spelling is rotten).

So I moved everything off it and have re-partitioned it to 8 drives of 250megs each and one at 205.87. So far I've not run into that earror again.

Hello friends from #atari. I am going to take a break from IRC for awhile. I have been spending way too much time on IRC, I need to get away from it and take care of some other things. I am going to get me a Linux box and spend some time learning it, this will be good for my job experience cause they use Linux at work. I also want to do some major changes to my web page. Anyway I will miss everyone on #atari, well, almost everyone :-) If you would like to keep in touch with me plese do via email. I am not sure how long I am going to take off, but I will be back.

A clue but no answer!

This sort of thing was happening to me when I was using CAB + GEMJING.
I would load the KUH htm and get a VERY low-pitched MOO.

At other times I got the expected MOO.

So I don't think it is anything to do with MyMail in particular. More
to do with Gemjing and, more likely, to do with other apps. which may
be running at the time.

1316. My Audio Video Experiment with Apex

Newsgroup: comp.sys.atari.st
Date: 1998-10-22 00:00:00 UTC
From: guitarra@afn.org
Message-ID: <70lvf6$4sf$1@maya.ece.ufl.edu>
Source record: 91421

Hi Friends, a while ago I did an experiment to prove that the
Falcon could play Full screen animated video and 50khz audio
simultaneosly.

Basically, I used Sam to store in RAM a 50khz sample and assign it
to the down arrow key which is PLAY in Apex Media. It works and I can play
using this method several samples while playing an animation.

Amaizing it is that you can even change ress while the audio is
going on without geting any glitches etc!

So my quetion is, why no one has created an Audio Video format for
the Falcon that would use a FLI and an audio file like AVR or WAV?
We have a great machine for video and having a Video sequencer would be
great. I tried Video Master but it is not realible.

I hope someone creates a format for the Falcon and TT

Thanks, Raymond

Well, I was trying out GemJing a couple of months back (just to see what it can do vs my PH Player) and I experienced this funny speed up & down during playback. This was directly from the OS (Mint). When this happens, I used PH Player to play a sample and then GemJing seems to recover to play at correct sample speed.

Just my 2 cents.

1319. sTTuff for sale

Newsgroup: comp.sys.atari.st
Date: 1998-10-22 00:00:00 UTC
From: Dan Phillips <xiting@worldnet.att.net>
Message-ID: <362E9FCF.2B1F@worldnet.att.net>
Source record: 91424
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

Well, I'm thinking of giving up the Atari (just can't get to Linux, no time). So, if you are interested, please let me know what you'd be willing to pay for my CaTTamaran system. I also have a few items I'm selling separately (prices don't include shipping, if you don't like a price, feel free to make an offer):

Floptical and 5 21 meg discs (internal) $ 75

105 meg Quantum LP105S SCSI HD $ 35
w/ External SCSI case $ 50

Maxtor 40 meg SCSI HD $ 15
w/ External SCSI case $ 30

NEC 3Xe external CD-Rom drive $ 50

All Things Falcon CD $ 5

TT system:
TT030 10/16
48 MHz CaTTamaran
Nova ET4000 1 meg card w/ v2.08 drivers (fitted inside TT, up to 800X600X32K) 40 MHz FPU (Motorola never supported over 32 MHz officially in PLCC, but my distributor got one from Motorola that was tested to 40, which I needed to get the CaTT stable)
TOS 3.06
HD floppy

You can't put a hard drive in the case because the stock power supply can't handle the accelerator, RAM, Nova, and a hard drive.

I also have an external tower SCSI peripheral case and Calamus SL, ExtenDOS, NVDI 4.11, and much more software that would go with the system.

Have you tried replacing the drive mechanism with another 20Mb RLL
drive, or a SCSI drive. The SH204 is made up of 2 adapter boards, one
ACSI/DMA to SCSI, and one SCSI to RLL. If you get rid of the 2nd one, it
might be possible to attach a SCSI mechanism (with parity disabled).

Cheers,
Nick

Hi,

hmm, so I'm certainly not the only one experiencing gear shifts.

Did some more tests in the meantime, added samples to all the features
there are for, changed the sample for "mail waiting" but this one loops
endless. All the others play one time. Even after clicking "details" it
continues to loop. Only after clicking "abort" it stops.

So next I reset the system, started up MyMail and it played in slow mode
again (gearshift 1). Next I quit, started Aniplayer, played one sample in
it, quit and started MyMail again: this time it ran in shift 2 (normal
speed). Quit again, started Aniplayer once more and made it play a sound,
quit again and started Mymail: no gearshift.

Well, the gearshifts are acceptable (still waiting for it to shift into
"reverse" :-) but the looping "mail waiting" isn't a nice one since it's
hard to interrupt for "get mail" or "abort".

Now Goetz asked me what's in my SND Cookie, anyone able to tell me how to
do this? I told you, I'm not a programmer...

Part 76735629867836 of this thread...

Aww, forgot something else: the "new mail received" sample isn't played at all... The "D/L mail" one goes OK, but I suppose I should hear "I'm sorry" (in my case) after the mail got in, but nothing there.

Just to make the picture complete :-)

Hi Tim,

just visited the page: looks OK.

Two suggestions: change the "starry background", some of the brighter
stars interfere with the green text.
The other: why in Christ's Name a DOS prompt on the monitor??????
You could have done better on that one!!! :-)

Indeed, web pages are an endless project!

Hi,

Funky Atari item up for auction:

** Wonderful, Wacky, Atari "VIDEO MUSIC" **

*** Auction ends tomorrow, Thursday, October 22nd, 1998 **

- unit only, very nice, clean, unscratched and in excellent working condition..
- The "Video Music" is a 1970's Atari device, shaped like a stereo component,
that when hooked up to a sound source (radio, tape, CD, etc) and a
television,
produces GROOVY graphics that pulse, shift and change colors to the rhythm of
music, etc, on the tv screen..
- shapes, colors and waveforms are controlled by varius knobs and buttons
on the
unit and can be widely customized..
- excellent display piece for a collection, etc..
- neat-o, unique; makes me wanna wig-out and get down..

** Bid currently at $127.00 **

Follow this link to bid 10/15/98 - 10/22/98 ('til 8:42 pm, PDT)

http://cgi.ebay.com/aw-cgi/eBayISAPI.dll?ViewItem&item=36100604

For any questions, please write to me at the e-mail address above..

Thanks,

Chris.. =)

Ik WAS een Atari user...
maar ik ben gezwicht voor Bill.

Aangeboden tegen elk (aannemelijk) bod

ATARI SF354 floppy diskdrive SS (360K)
floppy diskdrive 2x DS (2x 720K)
video interface (van ST naar TV)
Supercharger MS-DOS hardware PC-emulator 1Mb RAM
defecte Atari 520ST, 1Mb RAM (geheugenproblemen)
Verschillende jaargangen ATARI-bladen (ST, START, duitse bladen)

Op voorwaarde, dat je deze zaken bij mij komt ophalen, of vooraf de
transportkosten vergoed, accepteer ik elk bod.
Ik woon in Apeldoorn.

Met vriendelijke groet,

Fred van Deelen

->it's something mucking up the system during those times.

Hi Terry! Yep, I've encountered this same kind of problem, but its with SAM (system audio manager) and the very cool Elly MOD player. If SAM plays an "event" sound while Elly is playing a MOD, Elly slows down to half speed (or even quits altogether). I can then click on the freq. settings in Elly, and it will resume its normal speed. Somebody told me one time that SAM doesn't properly release DMA once it plays a sample, but I don't know if thats it or not. CoNnect's sound events do this sometimes too...All this happens whether I'm running Single-TOS, Neodesk/ Geneva, or Mint/Naes/Thing... Later! ;-)

Dan, what Tim said!!!! Once you've been an Atari power user (and looking at your setup, you surely qualify), things are never the same on any other platform. I've used Amiga's at home, Mac's and Windoze machines at work, and none of them bring me joy like my TOS machines do. After playing around with Mint for awhile, I'm probably gonna get a fast clone with Linux, but thats in addition *too* my Atari computers. If you'll take some friendly advice? Do the same! ;-)

I was told a while ago why this isn't very clever (or even possible),
IIRC it had something to do with interrupts.

This is beta-versions intended for members of the MiNT mailing list.
Release-versions is found on various ftp-servers, ftp.funet.fi should
be pretty updated.

>since there's no mention of MagiC in the demo version supplied with NVDI?

Yes this is a special version under the same shareware agreement as the original iPRN.

There are now two versions of iPRN, one is iPRN for TOS and the other is iPRN for MagiC - you will need to specify which one when you register.

More details when the manual is translated to English. ;)

Does the shell actually start? ie do you have a command prompt or do
you end up back at the desktop?

>>At worst the following 5 lines as a PROFILE will get the shell
>>started. The compiler and the rest won't work too well but it'll
>>verify there isn't a fundamental problem ...
>
>This didn't work.

Drat! :-(

>Hmm. Wonder what that "fundamental" problem might be?

Msh actually looks for .\PROFILE (ie simply open("profile",0)) so
there is a *possibility* that the desktop has another path set as the
current working directory when msh is started. Unlikely but possible.

>Too bad these guys don't have a web site! :-)

I doubt it would help much even if they were still in business. From
what I've gathered, only days before Mark Williams Company went bust,
attempts were made to backup coherent from the company machines. Not a
single copy was intact so I doubt the atari mwc faired any better.

If such a story is based in truth then it begs the question: "why was
such a critical piece of the company code corrupt?" which naturally
leads to "is this corruption the _reason_ mwc went bust?". After all a
third of all companies whose computer systems go down without recourse
to adequate backups go bust within 12 months here in the UK.

>>... and do ensure the folder d:\mwc\tmp has been created!
>Yup.

Something has just occurred to me. Try creating and using \tmp in the root of the partition in which mwc sits (ie d:\tmp I guess). See my post to Bob.

It's not. It does open("profile",0) so unless you've somehow managed
to get the desktop to execute d:\mwc\bin\msh.prg whilst having the
current working directory set to something other than \mwc\bin then it
will be finding it.

>However, to test this theory, I created an a:/bin directory and

Nope. This isn't the case.

>I've run into that before with early programs where the programmer
>made the (bad) assumption that everyone only had a single floppy
>drive, and hard coded filenames as a:\whatever.

The "problem" isn't that the shell is dumb, quite the reverse. The whole thing is based on COHERENT which is/was the MWC unix clone; and as such it'll quite happily let itself get mislead by assumptions or system settings that may already exist (but didn't back then) when you start the shell.

Ah! That has reminded me of something - iirc msh assumes the temporary directory already exists (on the basis that coherent must have created it else the system wouldn't have got far enough to even consider starting the command shell). Therefore when msh starts it is probably attempting to use the 'current' temporary directory until such time as the command shell temporary directory can take effect.

The 'current' temporary directory will be \tmp in the root of the
"coherent" partition. So in Alf's case he should create d:\tmp to keep
the shell happy until d:\mwc\tmp can take effect. This in turn would
indicate a glitch in the PROFILE for Ataris.

>I'm still confused. My STe has the RF Modulator video out, and I'm doing
>exactly what you described above, but what do you mean my tune to the band on
>which the ST is displaying?

To state the obvious, the TV transmits a bog standard tv signal out of
the modulator output so just plug a suitable lead into the tv aerial
input and turn the ST on. In an old "pushbutton" type tv all you'd
have to do now is manually adjust the tuner for one of the buttons
until the ST desktop appears onscreen. Job done.

Yer modern tv is a pita. You have to dig around in the manual looking
for the option which tells the tv to scan for channels, typically
skipping each channel that comes up until you hit the one you want. At

this point you get to figure how how to assign a channel number to what you are looking at whilst not forgetting to tell it to memorise it. Don't forget to wear odd coloured socks and stand on one leg - whilst not infallible you should have it figured by the time your attempts reach double figures! ;-)

>I'm using a regular (newer) VCR and never had
>to tune in to a specific channel.

The same principle applies here, except it's ST lead into aerial input of VCR. The only trouble with this is twofold ...

Firstly. Scart leads can cause the aerial input to be ignored. Secondly, the channel on which the ST transmits can conflict with an existing channel. Here in the UK I had to mess with the tuner inside the *ST* modulator in order to get it transmitting on a channel which the VCR could record properly. Gawd knows what the possibilities are wherever you live!

If this is a one-off job borrow an old tv off someone. Otherwise get hold of a ST->SCART lead which'll give a better picture anyhow.

I'm not clear on what you are doing, but I use the composite video output on my STfm all the time. I have to use low/medium, for the composite is not generated by hi rez. I did up a special cable to connect the composite video (aka "sync" on some pinouts/schematics) and audio to RCA plugs for the monitor. If you don't have one, a Monitor Master gadget (switch between color and mono monitors) that has composite outputs would work; they are commonly available for $10 here and there.

My STfm has an RCA jack on the back, but this is modulated video/audio, and won't go straight into the A/V inputs of the VCR. If this is what you are doing, you need to do up a cable arrangement per above to get the video from the regular monitor connection. OR, you can connect the modulated output from the RCA jack on the ST(fm/e) to the ANTENNA connections on your VCR.

If you have a cable going to the A/V inputs of your VCR already (in which case most of what I wrote before is boring to you), then it is only a case of checking your cables and making sure the VCR is set up correctly (a daunting task for some older VCRs). I've had this trouble occasionally, also.

Finally, does an STe even HAVE composite out? I used to think all STs did, but then I got hold of a 1040STf, and it didn't work! So now I know that ST's (old guys) and STfm's and STm's do, but STf's do not. Don't know for sure about STe's.

The SGS NET was a midi networking for the Atari ST. It came out around 1989. I believe I have some documentation stored away. SGS was a company out of California.

>Does the shell actually start? ie do you have a command prompt or do
>you end up back at the desktop?

MSH.PRG tries to access the floppy drive (I guess the built-in default for path is A:\), then pretty much gives up. I get a '$' prompt in the middle of the screen. The GEM desktop is still there, and the cursor is still on (and a bumble bee). That makes sense, really, since what clears the screen and turns the cursor off is in PROFILE, which it doesn't find.

>Msh actually looks for .\PROFILE (ie simply open("profile",0)) so

>4.11r?

A few months back I obtained updated NOVA 2.61 drivers from Nima and
I was using 1.68 which came with the card ages ago. The new drivers
Nima sent me worked but I noticed reversed/transparent text failed to
render properly in 24-bit mode so I went back to using the old drivers.
I figure on upgrading to NVDI 5 when the English version is out and
trying that on the card.

Greetings!

Okay, so here's the deal. I auctioned my Atari Mega ST2 system off on eBay. Then the top four (yes, all four!) either flat out flaked out or had already purchased systems by the time I figured out that the first gut was a flake. Bad Karma! Because I am moving in about two weeks and also because I want to avoid any more eBay charges, I am going to offer it here for a price substansially lower than the auction price - $125.00 or best. You pay the actual shipping costs to be calculated. It's all boxed up and ready to go. The system is:

Atari Mega ST2
Atari SM 124 Monitor
Keyboard, Mouse, power and connecting cords.

All in great shape, virtually no scratches, or blemishes. All works perfectly. No software (sorry, if I had some I'd probably keep it!). I don't know how to tell which version of TOS is on it or how much memory (I'm guessing 2 megs) but I'll be glad to try to answer any questions you have.

You can see a picture of it at:

http://members.tripod.com/~CameronVinyl/atari.jpg

The address is case sensitive.

Please reply by email or phone.

The CD ROM collection that came out about 2 years ago works great on my Atari STe. I got a utility called INFOCOM.TTP from a CD ROM compilation. I copied over the .dat files from the CD ROMs and then renamed the extender to .ING (InFocom Game) and then set the INFOCOM.TTP to run if I double click the .ING extension (I think that was called setting preferences).

NOTE: I am looking for the Mystery one, if anyone has one for sale I would love to have it. That is the only one I know of that I am missing.

> know that ST's (old guys) and STfm's and STm's do, but STf's do not.
> Don't know for sure about STe's.

The "M" stand for RF "M"odulator. So ST and STF don't have one, whereas
STM and STFM do. Then, the STE had one as standard too.

This only goes for countries where SCART or Peritel was not yet a common
standard. Here is France, no machines were ever sold with the Modulator,
even if they do have STFM markings.

Cheers,
Nick

I've seen quite a few painted amigas, especially among the demo crews.
They look quite cool IMO.

I've already painted plastics, so here is how to get a pretty good
result.

-sand the whole case with sandpaper, to give it a rough feel so that the
paint will stick to it. Wash it undet a shower or a tap to remove the
plastic dust, and let it dry.

-spray primer over it. Sand it again with grain 600 wet paper. What you
want is a soft finish, but not to remove the coat of primer.

-spray color over it. Let it dry.

If you're using spray cans, try warming them up in hot water (not
boiling). This makes the paint more fluid inside the can. Also shake
them A LOT before spraying.

The problem will be chipped paint if you tend to carry the machine
around a bit.

Cheers,
Nick

Thanks to everyone for your suggestions. I've got it working now.
It does work as a .PRG and it does work as an .ACC if the cache is
switched off, even if I switch the cache back on again after it's
loaded.

Thanks again,

Tim.

Hi Goetz,

according to PFile, the _SND gives hex $00000003 or dec 3

Size 51, free slots 20.

Hope this helps...

S.O.S. Help Aid!! Who can tell me something about the fate of SharpScore, the huge music DTP application produced by Take Control, Birmingham, till 1994 (I guess)? I'm the fortunate owner of a 3.2b Professional version (maybe the last of the series) and, since Take Control gave up business, I've been wondering why private or trade people haven't shown any interest in such a unique piece of software at all... Maybe somewhere in the world there's another Michael White (the guy working on new versions of Diamond Back and Edge, to save them from oblivion...)? I hope so. Meanwhile who can tell me something?

I've got a logitech mouse on my TT and it's been a wonderfull mouse, with the inner wheels being slick plastic, all I have to do is once in a while clean the ball itself. But now the feet pads on it have just about wore away after 4 years with me and who knows how long with the guy I got it from. Does anyone have any ideas as to what or how I can replace the pads so I don't have to hold it up off the pad anymore?

Source record: 91485

Hi,

I have just fished the Atari out off the attic and set it up to see if it still works. It do's, great I thought might as well get some use out of it. One problem though. It takes up a hell of a lot of desk space, Atari 520STFM, external HD, Monitor etc.

Anyway I have a an old PC AT desktop case that could easily hold everything with one problem. The keyboard.

So to my question (finnally). How easy is it to hack a PC AT keyboard onto the Atari keyboard interface. Anyone have details?

System:-

STFM 4Mb memory, TOS 1.4 (?), Overscan module, 28Mhz 68000 cpu with 16Kb cache (Cache switchable as is cpu fallback to 8Mhz), ICD DMA SCSI controller, 40Mb SCSI NEC HD, 720k double sided disk drive. Philips CM8833 colour monitor.

> but either way, there are an astounding number of screws holding the
> keyboard together.
>

That is exactly what it was. A very small, but definite break in the trace for the CTRL key. I missed it the first time I had the keyboard open (only three screws on mine, four if you include the ground.) I tried to fix it the same way (a bridge), but the ham hands made the break grow to almost 1/2 inch before I gave it up. Guess I'll have to order a new mylar.

I was also thinking of putting a strip of packing tape over the mylar all the way across as well as rounding the edge. Just a bit of preventative maintenance.

Stick a layer of insulating tape over them?

It would be even better if you could get sticky-backed PTFE tape but I
have only ever seen this as non-sticky 'plumbers-tape'.

From: Bengy Collins <collins@bulli.com>
Message-ID: <3630E8A4.E67AEB76@bulli.com>
Source record: 91491

Hello,
I have added an archive containing several programs which create a
keytabl.sys file for your desired language.
i.e.,
If you use a german version of MagiC but want a U.K keyboard, simply
replace the keytabl.sys file in your /gemsys/magic/xtension/ directory
with the newly created one and that's it. THis is only for users of
magiC 5.10 and above.
Thanks to Andreas for sending me this archive, it is the proper way to
remap the keyboard (the old patches on my page will still have to be
used for users of MagiC below 5.10)
That's it,
Bengy

Here's some Jaz disk info for you:

I use them daily in my job as audio/video engineer to transfer data between machines. They are mostly reliable, but watch out if you get a BAD DRIVE. I have one drive that will make EVERY jaz disk I put into it bad.. moving data becomes nearly impossible until I do a long reformat of the cartridge.

The way to test this is simple, but you must have 2 drives. Go to www.grc.com, and download their program called "TIP" (or "trouble in paradise"). It's a windows program, of course, freeware. Run it on drive A with the cartridge. If the cartridge shows errors, reformat it on Drive B, (again, long reformat) and try run TIP on the card in drive B. If the cartridge still shows errors, it's a bad cardridge. If the cartridge is fine, I'd move it to A gain, copy some files, and run TIP on A again. If there are errors, the DRIVE is bad.. most of the time, in my experience, it's not the cartridge that's bad.

A good option IMO would be to get the PC/MS mouse/AT keyboard interface
made by Mario Becroft, I'm using it now, without a doubt this is a great
little add-on. I'm testing it, but I believe it is near ready to release

From: Satcom2 <svenhard@primenet.com>
Message-ID: <36319101.5933@primenet.com>
Source record: 91310

I am looking for people to trade. I also will buy used stuff if I need it...especially later releases for the Falcon and ST. (ST 1993 and on, Falcon 1996 and on). Some hard to find ones I need are Sheer Agony for the Falcon (I have the ST one), Aazohm Crypt for the Falcon, Cartoon Kapers for the ST, and stuff like that, anything a bit obscure and cool. There must be some collectors like me out there somewhere, right? If you want to trade over IRC that would be really cool too. Kosher stuff only, don't worry*. E-mail me.

1408. STiNG problems and Zetnet

Newsgroup: comp.sys.atari.st
Date: 1998-10-24 00:00:00 UTC
From: kaitxo@cix.compulink.co.uk
Message-ID: <F1Bt09.EoE@cix.compulink.co.uk>
Source record: 91313

I set up an account with Freeserve (the free Dixon's account) and using STiNG have been connecting fine. No problems.

Last night a few connections were a bit slow, so I thought I'd try going back to my old provider, Zetnet, for comparison.

Using exactly the same DIAL.SCR as I had used before to connect to Zetnet, a very odd thing happened. I connected fine, but after a few seconds of the "Initializing link" screen, lots of bombs appeared and the computer froze. Since then, I've checked the DIAL.SCR, I've tried a number of times again to be sure it wasn't a one off - and the same thing happens almost every time. The only times it doesn't bomb out, it times out on the Link screen.

Please can anyone suggest what's happening and what I can do about it?

Andrew Harvey

>> know that ST's (old guys) and STfm's and STm's do, but STf's do not.
>> Don't know for sure about STe's.
>

My 1040 STe sitting here connected to the TV does. Again it is pin 2
and pin13 (gnd)

from back of machine

4 3 2 1
8 7 6 5
12 11 10 9
13

This is in the USA. #2is Composite #13 is ground. Buy an RCA
connector with a plug on one side and bare ends on the other.

eg.

----------]]]]],
----------]]]]]'

get 2 male crimp connectors. You may have to buy a
buid-it-yourself DB9 kit to get the connectors. Crimp to the
ends of the RCA plugs. Tape up excess metal where the crimp
is. Insert the ends into #2 and #13. Turn on TV and STe. If
picture is distorted make sure that you have the pins right.
You can either tape the wires to the ST to secure them, or use
modeling clay(playdoh works nice and dries quickly and forms a
hard casing)

Or get a longer piece of wire. There is a lot of room there, and the trace
seems to be deposited conductive powder, not metal. It is easy to make a
larger damaged area in finding that out. I have done this exercise twice.
The first time, the original patch was too thick and the edge was not rounded,
so the patch cracked after several months. I re-did it, and reinforced the
patch with thin tape, and all has been well for a year or so.

Yes there is. You have to find a program for the mac, I forget the name, which formats PC compatible disks which also the STE can read. Once you formated the disk just copy the files and you're Rockin' and Rolling. I think the program is shareware and you should be able to find it at like shareware.com.

My brother runs Calamus SL 95 and Calamus SL 98 (English version) on his
Mac G3 without any prob. I also knows a printer who uses Calamus SL 95 and
SL98 demo (German version, august release) on his G3. The only prob he
has is that it seems to be impossible to use his Ultra Setter. He also
complaints about the very slow printing speeds. Printing a large CDK on a
HP Lazerjet 4 takes sometimes 8 min and more.

Also as I've both the English (from MGI) and the Dutch August '98 (From
Invers Media) SL 98 release I can tell you that the latter works far
better then the English release. The English release bombs me out from
time to time. Some modules of the MGI version e.g. Phototouch refuse to
work.
If possible you should better get an English copy of SL98 from Invers
Media.

C'est normal par ce que l'archive est seulement compressï¿½ par GNUzip.
Decompressï¿½ avec GZIP.TTP (ou gzip) et renommï¿½ le fichier en mintnp.prg c'est tout.
Chaque archive contient seulement une version de mintnp.

Hi all,

I have been using MagiC for the past year and I think its a OS.Just recently I have read alot about MiNT telling how good it is and everything else.

As I have not used MiNT since v0.95 I was wondering what are the advantages and disadvantages over MagiC.

What can MiNT offer me that MagiC does now?

I also heard that MiNT needs its own partition so it may be hard to go back to MagiC if I want to.

Gordon.

No, but I can corroborate your findings. The same thing happened to
me:

Load Sting with default script (to zetnet)
Change dialscript to freeserve using dialer/config/Accept
Use Freeserve
Change dialscript to zetnet using ......
Connect .. get as far as Initialising .... 2 bombs!!!!

I wonder whether it is the Freeserve/Sting combo or whether it's just
Sting/Dialer getting its knickers in a twist at the change of host.

1) I am a MiNT freak
2) if you are perfectly happy with Magic, stay with it.
3) if you need to expand your horizons, learn new things, new type of
OS, new philosophy, MiNTOS is the one.
4) MiNT per say doesn't need anything, no minix (special partition).
NO special AES etc. however those 2 are wished for a real nice setup.

On Sat, 24 Oct 1998, Gordon Campbell wrote:

Yes it is. "Without MiNT I will not boot it" (as pahartik says).

>As I have not used MiNT since v0.95 I was wondering what are the
>advantages and disadvantages over MagiC.
0.95, won't make a big difference in the eyes of a magic simple user.
But will do for programers, or user to be able to use new applications
that require MiNT 1.15.

>What can MiNT offer me that MagiC does now?
does? or doesn't? confusing question :)

>
>I also heard that MiNT needs its own partition so it may be hard to
>go back to MagiC if I want to.
I heard that Magic needs it's own VFAT partition. (*NOT*). same thing
with MiNT and minix.
Might check my page out. Might give you some pointers.

Ok, I have some new news...

When I boot from a generic floppy and THEN go over to my Supra drive
(by "creating" an icon for this disk on the desktop via file|options or
whatever),
then d:\mwc\bin\msh.prg loads properly and finds d:\mwc\bin\profile JUST
FINE!

What this means is that my original suspicions are correct. It's got
SOMETHING
to do with the Supra Boot software (v3.0).

I noticed something else as well. When it all works, there is a MSH
environment
variable called "camefrom=desktop". When I boot off the Supra HD and run
MSH,
I get "camefrom=" -- definitely fishy!

I guess I'll try loading the latest Supra drivers and see what happens. I
have a
v4.x around somewhere. But I'm willing to bet that won't fix it. Maybe
there's some
battery-backed CMOS info somewhere that's invalid because the battery is
dead?
I know the clock won't stay set, and if there's any other critical info.
there...

Anyway, thanks for the help...

ALF

>if so, does anyone have experience as to which printers will/won't work?
>(The info I have with mine only referes to dot & daisywheel printers).

The DeskJets work very well with Ataris, and there are many programs
out there that support them directly. Just make sure you don't get
one that requires Windows. Most support Windows, but still work on
other machines. However, some absolutely require Windows.

I've used a LEXMARK 1020 with good results on STE, STacy and (best of all) FALCON. Use HP500c or HP550c print drivers for colour. It makes Pagestream much more fun. NOTE, don't confuse it with some of the recent Windows only models Lexmark have graced the market with, these are totally software driven. You can't even change an ink cart without probs on these. ARGOS in the UK were selling the 1020 up to a few months ago for 89pounds inc colour + b/w ink carts. Good luck,
regards, Steve

>[snip]
>
>Please tell us more!

I also have the latest 3.2 version - And the original demo disk... I got a bit embarrassed constantly ringing Take Control to ask about updates, plans etc. The last I heard from them was that the Atari market was - guess what - too small to justify further development. Maybe for the PC they said. I'd hung in there from the beginning because they mentioned the implementation of vector fonts for both music and text. Just what I wanted - to shrink or enlarge the page.

Apparently also copyright problems over obtaining a vector music font or some such problem. But an excellent program with midi support, that should have grown and grown.
Last Phone number I have - 0121 415 4155 (UK) Perhaps if we all .... well its just a thought. A bit like Calligrapher isn't it?

What exactly did you read?

> As I have not used MiNT since v0.95 I was wondering what are the
> advantages and disadvantages over MagiC.

That depends on the individual user. For many, MiNT has nothing that interests them, but there are just as many who couldn't live with out it. There are a great deal of unix apps ported to MiNT, because basically MiNT is a hybrid of GEM/TOS and UNIX. Lots of great powerful applications on the atari are only available to MiNT users. When I compare MagiC and MiNT I usually think of the example of windows95 vs windowsNT. Several of the differences are true. NT is more stable, more networking capabilities etc. while win95 is enough for most users.. ease of use..simplicity.. (Let me make this clear, I hate windows, I don't think its a good OS, I hate every part of it with a passion.. I was just using it as an example :-)

> What can MiNT offer me that MagiC does now?

To sum it up, ALOT more control over your computer

Hello everyone,
I have been working closely with the author of the excelent StringServer, and we have came up with a mini-support page. The author (Ozk) explains StringServer, how to use it etc in an easy, simplified manner. If you are curious about StringServer, if you are saying to yourself right now "what is stringserver!!?" then this sight is for you. Ozk has not been getting the feedback he had originally hoped (hardly any at all) so we are hoping that this site will change that. Please give StringServer a try, atleast go to the page, it is a very powerful program when supported!
The String Server Support page can be found at the MagiC Support page:
http://bengy.atari.org
Take care,
Bengy

1437. 1st Word Plus to MS Word Converter

Newsgroup: comp.sys.atari.st
Date: 1998-10-24 00:00:00 UTC
From: draltmeyer@t-online.de
Message-ID: <70s9rg$5ev$1@news01.btx.dtag.de>
Source record: 91342

Hi!

A friend of mine has changed from an Atari 1040 ST to an IBM compatible PC. Since he's kind of a hobby writer he's got tons of texts written with 1st Word Plus. However, being a complete layman with computers he did not loose any thought about that changing the system might have any impact on the accessibility to his 1st Word Plus-written texts (it's true!!).

Now he's in a desperate situation. He has been asking several friends of him for a solution (which is what he should have done before changing the system!) and the only proposition so far was to scan in the printed texts. Since I've got some experiences with scanning and OCR I'm convinced that he could as well type in the whole stuff a second time.

Since it's no problem to read Atari written diskettes on a PC, the "only" thing he needs is a 1st Word Plus to MS Word converter, but during my recherche in the internet I found only one converter called "SuperCopy" which costs the absolutely ridiculous amount of about 400$ (ridiculous means, it's far to expensive, in my opinion).

So does anybody know a cheaper converter, or some other trick to handle the problem (e.g. a 1st word plus to ascii converter might also be helpfull, though it means my friend has to reformat his texts).

Many thanks in advance

Ralf Altmeyer

I used Plasti-Kote "Ultra Vinyl" on my Falcon (and dash of my truck).
It is a flexable, non-harding finish. It's fairly tuff as paint goes.
Does stink for about two weeks however.
No prep other than cleaning. I don't think they have Indigo Purple
however:().

I kind of had the same idea, but was wondering if there would
be a problem with old diskzines from magazines that are now
out of production. I have a lot of ST Informer, but with the
renewal of the rag, I would think that a nono.

> advantages and disadvantages over MagiC.

That depends on your needs. MagiC is pretty simple to set up and use, but you can only go so far and then you'll reach the limit. MiNT requires more effort to start with, but give you extreme control over your computer, very good multitasking, lots and lots of good software (unix-ports) and the best networking available to Atari-users.

If you only need to run GEM-application for yourself and have a ST, TT or Falcon I would recommend MagiC. If you need to share disks or printers with your PC, want to use decent internet-software or have a Milan or Hades then MiNT/N.AES definitely is the thing for you.

> I also heard that MiNT needs its own partition so it may be hard to
> go back to MagiC if I want to.

Not true, although MinixFS-partitions are heavily recommended. I couldn't live without mine.

Without MiNT (and N.AES!) I wouldn't be using Ataris today. My Falcon/Afterburner running MiNT even outperforms my P2@300/NT-box in many aspects.

[>]You should be able to use any regular enamel. Do not use Lacquer, or
[>]a polyurethane based paint as the solvents will eat away the case.

thanks for the tips.

[>]Why would you want to destroy what is probably the rarest mass
[>]produced machine atari ever made?

well, if you saw the way i use it now you'd probably cry. the motherboard / mainboard is out of the case on top of a gutted PC with a pink and black bubble wrap bag from a ATX PC motherboard between the two.
the keyboard is across the room. in it's place i have DEKA II [from wizzatronics]
that is sitting on top of a home made wood box along with the floppy drive, which
i took out of it's casing.

so a purple and black case now sounds like a lesser evil?

the inside is all that matter to me. i hate the keyboard and case. i know a number
people have moved falcons to PC cases, which is what i will do in time.

I sprayed the top of my 1040 STe with plain gey primer, no sanding or anything. Got rid of the dreadful beige.

Take the front cover off. Using shipper's tape, cover over the power and drive pilot light holes, and the Atari logo if it suits you. Spray. let dry. Peel off tape. Reassemble. Cool.

1449. BigDos & Rwabs

Newsgroup: comp.sys.atari.st
Date: 1998-10-25 00:00:00 UTC
From: Pera Putnik <piters@eunet.yu>
Message-ID: <70uggtrav1@SOLAIR2.EUnet.yu>
Source record: 91354

I write currently driver for IDE hard disks for Atari (ST) machines. I want also including option for work with PC (MS DOS) format hard disks. I made simple routine which swaps High/Low bytes in word, and it worked very fine with PC disk. But for now only with 'normal' or Non-Bigdos partitions under 32 MB. Of course I want writing routines for work with larger partitions, up to 2 GB - nobody uses still such small partitions. It should work with program BigDos.
I think that it will be useful, since most of PC-s are equipped with IDE drives. Btw. what is by SCSI drives ? Is High/Low byte order reversed also ? Sadly I don't have SCSI interface on ST to check it.
Well, what I need is some help about writing that BigDos capable driver. I suppose that extended Bios function Rwabs contains additional 16 bit data of starting sector of block. I saw also some additional fields in GetBPB function, or it is new-extended function ?
So, if anybody could, please send me infos about these. I write driver in 100% assembler, and I don't know programming in C.
It would be best if you send me how put parameters on stack by function call - like in Atari (ST) Profibuch.
Also some infos about XHDI 1.2 will welcome. Some link, literature, anything.

Hi,

rite, next Q: how does Linux compare to Mint/Minix then? Getting very
curious since I've been considering setting up Linux on my TT for some
time now...
As you may probably know, Linux's beginning to get more and more
support... just recently a discussion started on whether or not Linux
should start to get "marketed" vs. Win where lotsa Win users are really
getting fed up by the Bill Gates Stuff and are converting to Linux :-)

On Sun, 25 Oct 1998, Louis wrote:

> rite, next Q: how does Linux compare to Mint/Minix then? Getting very
> curious since I've been considering setting up Linux on my TT for some
> time now...

and Q answers: I wouldn't bother using Linux on any Atari hardware,
but then again, it's a question of personal choice.

MiNT works better because it is optimized for the Atari hardware and
allows loading an AES (ie: GEM) on top of the kernel, so you get GEM
with Unix functionality as a bonus.

NetBSD is also interresting, because there is an actual port of it
designed for TT/Falcon and its mailing list is very active on making
new drivers for all the 3rd-party hardware that was ever made for
the TT and Falcon. There's some Hades users also.

Unfortunately, most people fail in getting NetBSD/Atari to install...

> As you may probably know, Linux's beginning to get more and more
> support... just recently a discussion started on whether or not Linux
> should start to get "marketed" vs. Win where lotsa Win users are really
> getting fed up by the Bill Gates Stuff and are converting to Linux :-)

There is no need for marketing. Word of mouth is already earning
Linux all the praise it needs.

Another thing that helps is, when Linux users gather up and help
ex-windows users install Linux and configure it. They've just had
those in Canada: "Linux Install Day". There was news coverage on
the most recent one. The goal is to soon have an international
Linux install day.

1457. Wanted Advice about getting my 2 Atari computers on the internet

Newsgroup: comp.sys.atari.st
Date: 1998-10-25 00:00:00 UTC
From: martin.w6@ukonline.co.uk
Message-ID: <363305f9.4940284@news.easynet.co.uk>
Source record: 91362
Cross-posted to: comp.sys.atari.st.tech,comp.sys.atari.st

First the hardware

Atari Falcon 32MHZ 4MEG 4.04 with hard drive etc
Atari 4MEG STe with Toplink interrace and 16mhz accelerator

The provider

Uk Online (PPP only)

Previous efforts have been hopeless mainly because half way
though I realised the software didn't have PPP compatibility
and then there was Oasis which fared no better. However I
believe Sting does provide PPP which I have downloaded and I
can make use of an old Cab version.

But before I start on the wrong foot again is there any
where there is a step by step guide or email addresses of
people who might be able to help.

What is the best software toI use?

Please note I'm not after a commercial solution. I'm using a
PC at the moment and would stick with that in preference to
coughing up money but would really like to get my Ataris on
the net

I rried installing HSModem before and while I did install it
I was never sure if I had done so completely correctly.

Any advice and info appreciatted.

1458. Caller-ID on modems

Newsgroup: comp.sys.atari.st
Date: 1998-10-25 00:00:00 UTC
From: louis@holleman.demon.nl
Message-ID: <36332bce558b4aa0@holleman.demon.nl>
Source record: 91363

Hi,

what about Caller-ID thru' modems? I know the older Zyxels had Caller-ID which couldn't be used in Europe, but since Caller-ID is common practise over here, I'm just curious about what modems support this feature.

Tell you the truth: when I ask at local (PC)computer shops, they don't know. I asked the local support site of the Dutch KPN Telecom biz and even these people replied "What???! Never heard of it!".

So the main issue is: do modern modems support Caller-ID (there even is a command set AT#CD for that) and thus can it be used on the computer by means of (already available) software (plus a subscription for it at your local phone company)?

Anyone???

Hi Martin,

first of, make sure you get the latest HSModem bunch (version 7 I
believe), then get DRVIN, MFP and SCC in that order in your Autofolder.
Have no clues as to special Falcon related stuff, but that should be in
the docs anyway.

Then, I would opt for Sting (up to v. 1.15, but beware, it may be
necessary to replace TCP.STX by an older version in case you experience
slow speeds). Sting's OK for PPP too. Should be LAST in the autofolder.

Other options are PPP-Connect (commercial, comes with the CAB 2.5 upwards
packages) or the Draconis stack (which up to now is still free for

evaluation but I couldn't get it running from MagiC. TOS was OK. Don't know how compatible it is for clients based on STIK/Sting).

As a browser I'd opt for CAB (1.5 latest freeware) but the commercial 2.5, 2.6 and now 2.7 have more options and are faster. Demo's available, but then no online-browsing. Note that for CAB-on-Sting you need CAB.OVL from Dan Ackerman, CAB-on-PPPConnect uses CAB.OVL from the package).
Other browsers: Adamas (part of the Draconis stuff) but I had nightmare experiences with it, Wensuite (commercial but simply a laugh; it's a No-GO).

For E-mail, FTP, IRC, Telnetting there is a broad variety of clients available. Nice option is Newsie, which does Newsgroups (on- and offline), FTP, E-mail and basic webbrowsing (no graphics).

Oasis was abandoned and from what I gathered was messy too. No regrets!

Best thing is to check with UK-online users for a correct Sting setup.

Good luck!

Use STing for PPP. Use HSmodem(drvn and scc) you do not have to
change any settings.

Put drvin then scc then sting in you auto folder.

put dialer.acc in you root directory
put the *.cpx in your cpx directory.

The difficult part is setting up the script file.

I had a hard time with the script until I found out that my ISP
dynamically sets the IP address. The only info I needed in the script
was the phone number, name and password.

CAB 1.5 works fine with STing and so does Newsie

Good luck

Are you having this problem when running Newsie after CAB, or all the time. I had big problems with cab.ovl 1.2904. I would cause CAB and all programs run after CAB to have problems finding directories and writing all sorts of wierd files that could not be deleted or renamed.

Mainly GEM applications like CAB,Okami and Airc and seeing as I am
running an STE 4MB then I would be rather limited.

Hi William. I can't comment on whether or not Mint will help with your CAB problem, but as to speed...Mint/Naes/Thing is much faster than any other OS I've tried on my Falcon. (note that I've not tried Magic).

For an example, even though I'm running quite a few more "layers" and apps just to get at my Thing desktop, its still faster. Programs like Aniplay-give a higher fps from the desktop than from Neodesk/Geneva I can run the lines program that comes with Multitos, and its easily twice as fast as my Neodesk/Geneva setup, and just as fast as single-TOS. This is under GEM. If you run a Unix port from a virtual console, then the scrolling/general speed is remarkable. Also, I can run more apps at the same time with much less slowdown than Neodesk/Geneva or plain Multitos. Hope this helps some. ;-)

>Finally, does an STe even HAVE composite out? I used to think all STs
>did, but then I got hold of a 1040STf, and it didn't work! So now I
>know that ST's (old guys) and STfm's and STm's do, but STf's do not.
>Don't know for sure about STe's.

For the original ST's, the 'm' part denotes that it has a modulator (and
'f' that it has a floppy disk built in, not separate as the earliest
ones had). So no wonder your STf didn't have a modulator. But AFAIK, by
the time it came to the STe's (extended) they ALL had modulators (not
sure about all the MEGAs though).

Well it is not because you don't know something that you can't start
learning it. Is it?
A parallel example: Yuo don't know nothing about TTRAM flag settings,
Will that hold you to get a TTram board? Don't know anything about
magic.inf, Do you still don't know how to edit it? Didn't you have to
add some extra lines in there for some settings required by software?
You don't know how to use a RSC_editor, so you will never change/edit
your desktop icons? well it is all perfectly fine. Just that I can't
imagine staying at the same level, no need to learn, no need to
discover..
Besides, the things you might learn in MiNT are applyable to other OS,
unix being the first one of course. So this is no waste of your brain
energy.

MiNT itself won't help you much, but since your problem most likely is
the CAB.OVL you're using the CAB.OVL for MiNT/MiNTnet might.

All personal:
linux has a better memory management.
linux has better libs, more support.
linux is heavier to install, no atari backward compatibility.
linux is slower, disc accesses, screen redraws etc.
linux does require its own partition.
linux needs a 68020 or higher CPU.
linux to get a graphical interface, you need a LOOOOTSA ram and speed
to be comfortable enough.

I am sure I forgot many other things. But that's what came out first,
so it must be the most important in my eyes.

Katherine,

love your comments - especially the ones like "Can I still learn
something?" :-)

So what's the situation? I'm starting to run out of diskspace, that's with
2x 850 meg HD's running.... (Gawd, I'm not talking Win/loose stuff here)
So I'm considering a 4.3 gig drive. Next was: Jeez, with all that space I
have space for experimenting... So first was the Mint stuff, next I
reconsidered because there's lotsa Linux whispering on the PC end, so I
figured a Linux installation wouldn't be bad either... The main thing is:
rite now I'm running TC on a Matrix GFX card, what about Linux support for
that one? Second thing is: I still need TOS/GEM/whatever partitions to run
TOS/GEM/whatever apps.
This looks better from the Mint end: it can be run combined.

As far as hardware requirements, no problems: got a TT here, plans are to
upgrade to a 68060 system, the bloody Aixit card with 64 megs still has to
arrive (ordered 3 weeks ago) but at least I should have 68 megs to run for
Linux...
From what I gathered, Mint is stable (well, so is MagiC, provided you
select the programs you run under it) but Linux appears to be SOLID. Means
no longer running Thing, Okami, Sting whatever :-)

Haven't made up my mind yet, but the compatibility thing perhaps make me
choose for Mint or NetBSD (oh gawd, here come da troubles again...)

Petr

1477. L.A.P.D. giveaway - almost

Newsgroup: comp.sys.atari.st
Date: 1998-10-25 00:00:00 UTC
From: clive@lapd.demon.co.uk
Message-ID: <36357517.4249084@news.demon.co.uk>
Source record: 91382

The closure of L.A.P.D. at the end of September means we have two sets of approximately 2,000 PD, shareware and licenceware disks each (all in large Posso disk boxes (included in sale)). One set is our masters for the library, the other is our back up copies. The disks are mainly for the ST but there is also a small Falcon library included.

Not wanting to see these lost to the Atari community for all time, we've decided to let them go for the highest bid received by midnight on the 1st November 1998. There's no minimum bid, so don't think what you can offer is no good - if no-one else bothers to bid, you'll get the disks!

Send your bids to clive@lapd.demon.co.uk

Visit http://www.lapd.demon.co.uk/ to see the full lists of disks included (go past the R.I.P. page and into the 'catalogue' section).

1. Library A (the master) is complete. Library B (the backups) has not been updated for some while so will have newer disks missing.

2. State whether your bid relates to library A or B or both. Or if you bid for A and fail, do you want the same bid making for Library B?

3. The successful bidder MUST collect the disks from L.A.P.D. We have no intention of attempting to pack almost 30 Posso disk boxes!

4. The odd disk here and there may be missing for various reasons (i.e. withdrawn by author, withdrawn by L.A.P.D., corrupted by the passage of time, etc.) The successful bidder must accept that L.A.P.D. accept no responsibility for this fact .

5. To the best of our knowledge and belief all of the disks in both libraries are in working order and virus free. However, in the event that the ravages of time have had a detrimental effect on any disk the successful bidder must accept that L.A.P.D. accept no responsibility for this fact .

6. If the successful bidder intends using any of the disks to start their own library, then it will be the responsibility of the new owner to seek where relevant the permission of authors for their work to be diseminated through the library. This is particularly important in the case of the Licenceware disks. L.A.P.D. cannot pass on this permission and make no implication that any permission has been given. As far as L.A.P.D. is concerned, the disks are sold for personal use.

Hallo Atarians!

Can anyone tell me if it is possible to use Timeworks DTP under Magic?
I get problem with the Screen.wid and Publish.wid when I run Fontwid.app.
First I gave it up, but after getting Easydraw to work OK, I thought perhaps that the DTP-ing would be possible too?
I am used to these good old programs and like them very much, though they are not quite up-to-date. Besides I have a lot of files that I would like to acsess. I hope someone can help me?

Norvald Bordal

PS:
Do anyone know where to find CREATHTM.PRG ??
(I once had it, but..... And now I could need it!)

>
>Uk Online (PPP only)

That's OK.

>However I
>believe Sting does provide PPP which I have downloaded and I
>can make use of an old Cab version.

Yes. If you want to do it for free Sting is the thing to use.
Otherwise ASH do a TCP/IP stack which gives PPP connection - I
Connect.

>But before I start on the wrong foot again is there any
>where there is a step by step guide or email addresses of
>people who might be able to help.

Just ask here, we have all been through it!

>What is the best software toI use?

HSMODEM v7 to correct all the serial glitches.
Sting/Dialer v1.15 to get the PPP connection.
Newsie v0.92 for e-mail, news, ftp.
aFTP if you want more ftp flexibility.
CAB v? for web browsing.
CAB.OVL v1.3011 to provide CAB with an internet interface.

There are also other clients for other I-net modes but I don't use
these.

>did not loose any thought about that changing the system might have any
>impact on the accessibility to his 1st Word Plus-written texts (it's
>true!!).

Use J. Scheerder's WPLS2RTF converter:

WPLS2RTF translates files in the First Word [Plus] format to RTF
(Rich Text Format) files, an interchange format supported by
many word processors and widely in use as a means of exchanging
documents. Supplied are Atari ST, Macintosh, and DOS binaries...

The archive wpls2rtf.zip (136839 bytes) should be available at any good
Atari FTP site. The author's URL included in the docs no longer exists,
so I've made the archive available on a temporary basis:

http://www.dsoe.com/people/roughley/wpls2rtf.zip

Nicholas... if you're reading: This cross-platform converter should be
mentioned in The Atari ST Quick FAQ, with an FTP link to a site that has
it. By rights the converter should be able to handle WordWriter
documents, too (something worth mentioning).

> > have made and released on a non profit basis..

Uh not really. It probably cost me over 200 quid in postage & packing
to collect it all. Seeing as even cheap PD libraries sell it for a quid
or so a disk, I didn't think 10 quid for about a thousand disks worth
was too bad. That's without the time it'd take me to catalogue 1000
disks worth of software.
Anyway for the rest of this article, we'll assume I was making a fiver
or whatever a disk.

> Just because the majority of original authors are probably long gone,
> that does not give anyone the right to pop up and starting making
> money out of there work, PD and FREEWARE should NEVER be sold for ANY
> profit, You would be making around 7-8 quid a CD

I wish. You are right that I would be selling it for more than the cost
of the media and postage, however that is the smaller part of the costs
incurred. Anyway nobody seems interested so I won't be bothering.

> CDs
>
> 1) It takes time to collect and copy the titles..
>
> ** Not as long as it takes the authors to write the titles and release
> for FREE **

It costs the author about 50p to send out a copy of the program be that
paid by them or the reciever, if I can save whoever pays that money 49p
a time AND make a profit (not that I would have) then as far as I can
see, that's a win-win situation. If I said to you I could send your
software out to people on a floppy for just 1p, to be paid by your or
the reciever (your choice) and I told you I was making 0.1p for every
copy sold would you seriously say that I couldn't do it? Do you
disagree with ISPs selling access to Usenet despite us all contributing
for free?

> 2) It is a bargain to the person buying it..
>
> ** Thats true a tenner for all that, or a fiver even is a bargain,
> from the buyers point of view. but look at it from the ATARI authors
> point of view, he makes NO mony for all his hard work, then up pops
> you with a CD writer to line your pockets :(**

If you don't want your software on a CD then I'm not going do it anyway, I assure you I was quite are of your views, your software would not have been on it. If I created a program I was proud of and was prepared to dedicate a lot of my time to it, I'd want to ensure as many people as possible saw it, if someone offered to give it decent distribution at no cost to me (and saving me the cost of emailing/mailing it to people) then great, even if they did make a fraction of a penny on every copy sold. Tucows mailed me the other day infact to ask me if I was happy to let one of my programs be on their CD, if I was still able to actively support the program then I would have had no hesitation in letting them do so.

> distributed for FREE

I don't think you can speak for the views of anyone but yourself, I don't believe the vast majority of people who write PD software would object to a project like this. Look at things like Linux CDs, software distributed under the GNU system, people that want their software to be really free, full source code available and the right to re-distribute modified versions of that software (with limitations), they seem quite happy to let CDs with that software on be distributed for 10-20 quid. You are entitled to dictate what people may and may not do with your software and I'm not going do anything with it that you don't allow. However why you want people to pay more for your software and let others indirectly profit indirect (BT, Post office or whatever) as opposed to letting them buy it for a much lower cost with the possibilty of the person who copied the CD taking a small cut is beyond me.

Wow. Thanks. It was burried in a friends attic. It seems to have
come from a business that went under, and everything was up for grabs.
People grabbed things like a modem power supply without the modem. A
real mess. All I found was this box, but I'll keep looking for more
stuff and software. Thanks again.

Yes they are alive and yes they have a demo version downloadable from: http://www4.pair.com/gribnif/

I must say you'll be able to download a lot of demos, sharewares and freewares from the UTSI (Ultimate T.O.S Software Index which is my site created about 1.5 year ago ...)
Then, let's have a look at:
http://ping4.ping.be/dipching-drulkhor/PRG-IND.HTM

> What's MagiC and what can it do? I'd appreciate if you
> didn't just give me the URLs and stuff: pretty useless with
> terminal access and the Lynx browser.

Then sorry for the upper urls :| ...

About MagiC ... that's The actual multitask system which is really on the way for a number of users ... coincidentally I have just installed it after about 6 years working with Geneva which is in my opinion more compatible with older programs BUT ... MagiC is faster than Geneva ...

> Are there any offline HTML browsers for the ST and family?

Of course you can try CAB (Crystal Atari Browser) which is really the best for the moment ... and yes, it exists a demo version for the latest version 2.7 ... you can also try WenSuite which is really four times faster at displaying web pages and there is also Adamas/Draconis coming ...

> What would be the starter's one and only graphics editor on the ST
> platform?

I believe there are a lot because ... there are a lot ;) ... let's have a look at ftps or UTSI at the graphic page:
http://ping4.ping.be/dipching-drulkhor/PRG-GRAP.HTM

Well that's all for the moment ... you surely remarked I didn't
answered to your programming questions ... I'm not really a programmer
but I'm sure you'll receive "a lot" of related answers thru the
comp.sys.atari.st ...

Sincerely yours

Jo

Hehe, if it stinks, kick them out of the window :->>
What in the hell do you doing with a falcon case? :)

Some here use simple plasic paint from the modell shop..

Simple use as spray. Remove internal hardware, remove finger fat
(with cleaner) from case and spray it.
After 10 minutes replace hardware. Finish

But this paint is still expensiv..
(And scratch resist)

Colorised ct2 falcon looks nice with ferrari red? :->

> if I hadn't done that?

It should be OK. PC's do not attempt low level format IDE drives.
From what I have heard the Atari ST's or better Format options
apparently do. (Unless this is the format option within a drive tools
setup menu and not the standard TOS format option).

I cannot confirm this though because I use an scsi host adapter.

> Why shouldn't you format IDE drives??

The Atari was originally used with semi-inteligent hard drives such as
scsi. These drives can re-learn their configuration after a low-level
format. IDE drives are cheaper because they are more dependant of the
host computers cpu and are less intelligent. Most older IDE drives
will accept a low level format but they cannot re-learn their
configuration afterwards rendering the drive useless. The drive would
have to be returned to the manufacturer for re-processing (Although I
beleive some IDE re-formatting software was available for the PC to
correcty low level format this type of drive. This may of been
manufacturer dependant though).

Some newer IDE drives appear to be protected against this accidental
damage by refusing to be low-level formatted.

The Amiga computers that contain IDE interfaces have the same problem
with their generic HD setup tool HDToolBox which is primarily for use
on scsi. It will setup an IDE drive but will also allow a low level
format to be attempted if the option is selected. However their
standard WorkBench disk formatter only performs a High-level format
that dosen't erase the drives configuration data.

Setting up MiNT isn't that difficult if you read the docs.
Following the docs of KEMD I managed to get the whole thing working just
in one hour.
These bad message are very likely because you don't use the right starting
order. Try it ones with MiNT as last prog in autofolder.

I bought me the MiNT 98 CD too but for the moment I haven't the time to
install it.

paxton@zetnet.co.uk wrote:

>>You're making the assumption that time is free, which it isn't. I make

> Why am I?.it certainly does not take 8 ukp worth of time to do one CD

"One CD"??? In what world are you living? To collect 600Mb of software
you can publish, you have to download atleast 800Mb, check all
archives for errors, read *all* licenses to make sure that you don't
violate them, make a index, perhaps build some sort of database,
design inlay, buy disks, spend atleast 15 minutes writing each CD
you're selling, print inlays, take orders, pack CDs, go to the
post-office...

> I Like to see my work spread, but what I find disgusting is to to see
> 8 years of my free work being sold for a profit... I hate to see other
> people making money from my or anyone elses years of work,

So instead of getting your software spread for free, you'd rather
spend money on sending out the disks yourself?

>>Read it again. Current freeware/shareware CD-ROMs (like the Walnut
>>Creek series) cost more than a tenner, and their production-costs are

> and they IMHO are total rip offs :(

I find them really handy, so we obviously disagree.

>>And I ask again, what did L.A.P.D. or Goodmans do for several years?

> What did they do?.. are you suggesting they ripped people off?... I

The sold floppies with free/shareware and made a profit. I don't mind,
you obviously do.

>>And what about ISP's and phone-companies that make zillions each year
>>on the distribution of free software? Or the postal services, should
>>they distribute free software for free? Hey, I've heard that Red

> Now your being far fetched.. why not say the road sweeper is making
> profit from my work because the post office use roads to deliver blah
> blah.... thats plain childish :(

So where do you draw the line? It's OK to make a profit on freeware by
selling ftp-space, but not by selling CD's?

>>Distribution costs money, and in the case of PD CD-ROMs you pay for
>>the convenient storage, the indexes, search-tools and whatever extra
>>services the seller includes on this disk.

> YES I AGREE... that is correct.. and you get a bargain.. but thats
> from the buyers point of view...

I repeat, you pay for the extra service. I'm fully entitled to charge
for *my* work (if I was making a CD), which is collecting, cataloging
and distribution of software.

> But if a CD contains FREEware or PD software then you should certainly
> not be lining your pockets from other peoples work..Its immoral and
> its wrong..

In your opinion perhaps, but judging from what's the case in the real
world, not many agrees with you. And it's certainly not illegal...

> Lets suppose you release a FREE or PD title and the next day someone
> says to you that they are going to package and sell it for a profit

If they package "Taskbar" and sell it as "Taskbar" for a tenner then
they've violated my copyright. But if they include it on the "MiNT
'99" CD along with a lot of other free stuff then I wouldn't mind at
all.

> think again :) small profit or big profit theres no difference.

Then you have to say the same thing about ISPs, phone-companies, the
postal services and everybody else that makes a profit on the
distribution of free software. Anything else would be just plain
stupid.

>Does that answer your question?

Yes it does. Thanks.

One of the nice things about VFAT is you can have every partition
VFAT enabled and they can all be accessed from TOS. Also, long
filenames and filenames with lowercase are no problem for TOS
programs, since they all have 8+3 equivalents.

I was wondering if minix shared these same benefits. Clearly it
doesn't. So that's another point in favor of MagiC (unless there's a
VFAT extension for MiNT).

I don't know anything about MiNT '98, but you should be glad that you
get those messages and the possibility to continue, rather than
"Ungultiges blargh" and a total crash...

> Makes me afraid :-)

Don't be. Find out which processes crash and read their docs. MiNT '98
is a very comprehensive setup, perhaps *too* comprehensive if you
don't know anything about unix in advance.

I can only say that Photoline 2.25 (TT-version) and Texel 2.0 works
fine here (MiNT 1.15.1b, N.AES 1.2.0)...

You probably running MiNT with memory protection. In which case, if
you don't know the quality of your GEM application, you shouldn't use
memory protection. Many software and/or protocol were not thought with
memory protection in mind. So most likely MiNT memory protection
scheme will complain.
Just rename mint.prg into mintnp.prg that's all.

VFAT is only good/interesting for 1 thing, and you just said it.
VFAT GEM prog might have prob as much as on minix. no difference here.

>I was wondering if minix shared these same benefits. Clearly it
>doesn't. So that's another point in favor of MagiC (unless there's a
>VFAT extension for MiNT).
yes indeed, it does. Even FAT32 as the matter of fact.
Ouch, another point for magic because of VFAT? hmm oh well.
I bet a point in favor of W95 is coz it has a taskbar with a start
button. ;)

You sent this to every Atari group but the correct one 'comp.sys.atari.st'
(so I added it) as it is a monochrome monitor for an ST/TT. It allows
high resolution (and only this level) on all 16 and 32 bit Ataris. For
low or medium resolution, you need the SM1224 (RGB color).

On Mon, 26 Oct 1998, Headley Sappleton wrote:

Minor correction here - the SM124 is NOT compatible with the TT. The
same is true for all other ST monitors. The TT uses a color VGA monitor
for most video modes, and the mono monitor for the TT is a big 19"
beast.

> must charge to get that money back... but please pay a little
> attention here.. that is COST and yes you should charge to get that
> back.. that is NOT profit...

But you see, time costs money. I think that's the point you're missing. You see, you're just saying that it's only fair to get back the cost of the CD, the internet time, mailing costs etc. But the actual time and effort put into the CD is in itself a product, and we must trust the composer of the CD to charge us a fair price. I do not see what is wrong with paying someone for their time that they spent to index, download (whatever) and burn the CD. After all, if no one made any money off it, do you really think their would be any Shareware/PD CD's out there? Do you really think Red hat and such would sell LINUX if they made no money? The money is the incentive, and it should be there. When you buy a shareware/free ware CD, at least for me, it's because its more convenient then downloading all those programs.. checking them out etc..

> But what I am apposed to is if that CD has freeware or PD on it.. then
> it's whatever is added on for PROFIT that I am apposed to..

Why are you against a profit? As I said, the person who sells the CD DESERVES a profit. Sure, the programmer(s) "sweat" for a year(s), but you don't think the person who put the CD together didn't sweat(so to speak)? You think you can create a quality PD CD overnight?

> Please STOP quoting how much it costs to make the CD because I already
> told you that is fair and correct to charge to get that back... its
> the.... ho sod it.. your not even paying any attention are you ?...
> sheesh perhaps if I draw you a picture? will that help ?

Yes Tony, draw a picture, I would like to see how one could illustrate this particular situation in a drawing.

Take care,
Bengy

On Mon 26-10-98 19:15, Katherine L Ellis scribbled:

>VFAT is only good/interesting for 1 thing, and you just said it.

Which one thing are you talking about? There is the ability to have
long filenames, lowercase filenames, retain TOS compatibility and
Windows compatibilty, and it can be switched on and off at will.

>VFAT GEM prog might have prob as much as on minix. no difference here.

Not really. Most programs will work even with VFAT enabled. For
those that don't, it can be turned off temporarily, very easily.

>yes indeed, it does. Even FAT32 as the matter of fact.

Cool.

>Ouch, another point for magic because of VFAT? hmm oh well.

You missed the point. The point was the ability to have long
filenames, etc., without having to use special partitions. But if
MiNT can do the same thing, then I misunderstood. I guess the point
would be that VFAT has some advantages over minix, rather than over
MiNT itself.

1519. Help with Harddrive!

Newsgroup: comp.sys.atari.st
Date: 1998-10-26 00:00:00 UTC
From: Anton Gustavsson <anton@ebox.tninet.se>
Message-ID: <3633D0FB.1DCF18D9@ebox.tninet.se>
Source record: 91244

Hey,

I have not used my Atari 520 ST for two years, but today I brought it down just for fun and I remembered the harddrive that I never got working about four years ago.......
So I'm wondering if someone could help me, now that I know a little bit more about computers in general.

It is a 40 MB 2,5" IDE harddrive. There is nothing wrong with the drive, I tested it in my PC and it worked just fine. But in the Atari, it won't boot...
The drive is connected to an ATC card, which means AT-BUS TOS Card, it includes a TOS upgrade to 2.06 and an IDE hostadapter.

There is a switch so I can choose to run TOS 1.0 or 2.06.
On 1.0, I can boot the computer with the harddrive connected, but TOS 1.0 was not designed to handle harddrives, so there is not much use in that.
If I remove the harddrive, I can boot with TOS 2.06.
But when I try to boot with the harddrive, nothing happens.....the red light which indicates harddrive activity goes on and the system freezes after reading the floppy boot sector.

There was a floppy disc included labeled "SCSI tools", with instructions in German....which I couldn't fully understand, but it said something about IDE drives not being able to boot properly on some systems, and that you should run a program that creates a boot sector on a floppy disc in order to be able to boot the hard drive. I tried that, but it didn't work either - the system just freezes.

Since I don't use my Atari anymore, it doesn't really matter, but it would be fun to see it working...let me hear your thoughts on this!

I suggest that you use STinG. It's fairly easy to setup and
offers PPP. The hardest part is seting up the Dial script
that STinG uses to logon on to your service provider.

As I use Zetnet I cannot help you with your dial script.
Perhaps the best thing to do would be to telephone the
support desk of UK Online, explain that you wish to use
your Atari to access the Internet and ask them what their
logon process is.

Hope this helps.

Regards,

Ben Hills.

I don't know anything about Caller-ID modems myself, but there is
software available for the Atari platform that is designed for use
with Caller-ID modems. Perhaps you could ask the authors of the
software which modems they would suggest.

> Many thanks in advance
> --
> Ian

As far as printers are concerned, just about any PC printer can be connected via the parallel port. The only thing to worry about is those cheap "optimized for Windows" printers, that are so optimized they are incompatible with anything else.

Then you will need driver software. On the Atari, there is no universal system driver, so you will need a driver for each application you will be printing from. Luckily, most modern applications use GDOS or SpeedoGDOS for printing, so make sure you are using a GDOS compatible application, SpeedoGDOS or NVDI, and a GDOS printer driver.

NVDI, which is also a screen accelerator is shipped with plenty of drivers, and there are other Speedo drivers on the net.

Basically, if you buy a printer, you should also get NVDI, as it comes with lots of drivers, and it works with most applications.

Cheers,
Nick

It is a GEMDOS enhancement with Unix capabilities, yes.

What makes you think it would be slower??!! How about, faster?

You cannot. Linux and NetBSD require at least a TT or a Falcon.

Your best bet is to install MiNTos, using the KGMD package or
the english version KEMD_R2. See http://kellis.atari.org for
more info about it.

I have run NetBSD/X11/fvwm2 on both an F030 (in VGA mode) and a TT (mono).

On F030: unusable with 4MB, dog-slow with 14MB. Adding a 68882 helped a lot.
Recurrent problems apparently caused by Falcon's dodgy SCSI, leading to
system freezure.

On TT: was already usable with 4+4MB, runs great with 4+32MB. Admittedly I
haven't tried any really huge software yet (e.g. Xemacs or Mozilla), but I
have done things like rebuilding the kernel and running big compilations;
sometimes it takes all night but it keeps on truckin'. (And I can read my
email or visit a web site while that's going on, no problem).

I'm inclined to keep my Falcon running TOS/MiNT, and use the TT for NetBSD.
I just wish sometimes that I could run e.g. Calamus without having to reboot
into TOS ...

The released version of 68K linux requires a 68030 and an FPU. The STE
has neither of these.

It appears there might be a version compiled for a 68000, but I don't
know where.

You might rather go for MiNT, which is very Unix-like, but also TOS
compatible. There are many unix utilities that have been ported to MiNT.

Cheers,
Nick

Not sure if this will work, mainly because of the Minix filesystem, but:

Try setting up PaCisfiST (pacifist.atari.org). Get the KGMD and KEMD2
archives from ftp.funet.fi, and follow the instructions.

You might want to set up a seperate partition on you PC to be used as
the STs minix filesystem.

Cheers,
Nick

Yes, Check out the Quick FAQ, which has a step by step guide:

http://quickfaq.atari.org

or this page which should also have what you need:

http://www.acay.com.au/~stevebj/sting.txt

> What is the best software toI use?
>

HSModem for the serial port
STinG for the TCP/IP connection
CAB + CAB.OVL for the Web
Newsie for mail and news
Aftp for FTP
etc...

You could also go the MiNTNet route, but it's a bit more fiddly, but
you'll have full multitasking too.

>
> I rried installing HSModem before and while I did install it
> I was never sure if I had done so completely correctly.

For the STE, just stick the DRVIN.PRG in your AUTO folder, and then
MFP.PRG (in that order). For the Falcon, it's DRVIN.PRG and then
SCC.PRG. That's it.

Cheers,
Nick

I he no longer has an ST to play with, set up PaCifiST on his PC
(pacifist.atari.org) or WinSTon (winston.atari.org). then get the Marcel
text editor (http://ftp.lip6.fr/pub/atari/Text/marcel23.zip). This can
import most Atari file formats, and export RTF or TXT without any
problem.

>
>Is a minix partition compatible with TOS and TOS programs, as VFAT
>partitions are?

I am not sure exactly what you're meaning:
i will take some guesses.

From SINGLETOS, you can not access (read/write) minix partitions.
They will be NOT accessible.

When MiNT and the minix.xfs are loaded, It is all accessible fine.
What diff will you see with standard FAT fs, well support of long
filenames, fileattributes, case sensitive, symbolic and hard links,
will be a tad faster, and probably more reliable than the old FAT.

SOftware to optimize FAT partition will ruin a minix partition, so not
compatible. but well, will mess a VFAT partition as well.

Software installed on a minix partition run perfectly fine. Not all of
them though because of the lowercasing, in example, you run
my_program.prg in the code it looks for MY_PROGRAM.INF and RSC.
which won't be found coz MY_PROGRAM.INF is NOT the same as
my_program.inf. I have to say though that I have MANY GEM applications
running from minix. (just faster :)

Does that answer your question?
For testing, you can convert a floppy to minix. You can experiment
from there. No harm.

Well, it sounds like you have some kind of wierd internal IDE board.

Normally TOS 2.06 should autoboot with an IDE, but it probably fails to
find the bootsector and driver, since you probably never managed to get
far enough to install them.

Have you tried leaving it on with the white screen for a few minutes.
Maybe the desktop will come up finally, like when you try to boot
without a floppy.

You might better try using the good old AHDI tools instead. Get them for
the Quick FAQ. Boot up the machine with TOS 1.0 if TOS 2.06 really
doesn't work. Run the AHDI.PRG and see what it says. It should detect
the IDE drive.

Run the Hdx.prg to partition the drive (never FORMAT an IDE!!!), an then
the hinstall.prg to install the driver. Then reboot.

Hope this helps

Cheers,
Nick

Was the hard drive formatted under TOS 1.0. TRy removing the HD
driver by renaming it. Then load the HD driver from the floppy. I'm
not sure about TOS 1.0 but later TOS'es will try to boot up from C
drive if Available. If the HD driver is corrupted and the computer
attempts to boot from C drive, you will have problems. What HD driver
program are you using.

Careful: a typical Falcon (4 MB, no FPU) running X11 atop mint/linux/netbsd
will be slow, simply because X11 uses floating-point arithmetic. You have
to expect a visual interface which runs on all kinds of video hardware (X11)
to be slower than one targeted to specific hardware (VDI and esp. NVDI).

For text mode you are right: the unices are no slower than GEMDOS, and may
even be faster. But I think few would want to use a Falcon in text-only ...

yep just disasemble paint and reasemble,

my ste and stfm and sm124 monitor are metalic blue and chrome, i just used car paint (arosols) the monitor was a bit more fiddly, however we took the back of and covered the insides with a poly bag and covered the screen with masking tape before puting them back together so that paint geting in the holes wouldn't get in the electrics.

mind you, i'm not about to paint my girlfreinds nec laptop just yet :-)

The SPIN-documentation claims that SPIN can read Joliet CDs. Well,
I've just burned a Joliet-CD with EasyCD Creator on my brand new PC
(which btw. has caught fire two times in four days. Luckily I'm
keeping my Falcon...) and SPIN doesn't recognise the long filenames.
No problems on the PC (which is running NT4sp3).

Has SPIN problems with Joliet-CDs, or is there are problem with EasyCD
Creator?

paxton@zetnet.co.uk wrote:

> A tenner a CD ?...that would be profit making...how can you even
> consider making a profit from ATARI PD and ATARI FREEWARE that people
> have made and released on a non profit basis..

a) It takes time to compile the CD and make a usable index and
navigation system.
b) It takes time to write a full CD, atleast 15 minutes with the
fastest drives.
c) Jewel-case inlays and CD-labels takes time.
d) Taking orders, packing and sending disks, handling the various
forms of payment takes time.
e) (c) and (d) also costs money.
f) So does the disk.
g) And the CD-R.

I don't think he will make much profit of such a project, and
considering the price of similar CD's I really don't understand why
you're getting so upset. If you read the license-agreement for most
free/shareware you will also see that the author allows distributing
on compilation-CDs and through PD-libraries.

And what about PD-libraries that sold (some still do) freeware for
several years? Are they pirates as well? Or ISPs that make money on
all the freeware that's downloaded by their customers?

Source record: 91279

Hi everybody,

I'd like to share with you my experiences with a newly found
"feel-good" platform -- the Atari, but with an odd twist to it:
in the past few weeks I have been exploring Atari ST emulation
on my PCs, both of which are now set up as quasi-STs using
Gemulator 3.8. It's been a red-eyed couple of weeks on the
Net (I'm currently unemployed :) And tell you what, I wish
I had done this a long time ago. I am very impressed with the
old Atari OS (SuperTOS), as well as Gemulator's stable performance
on my faithful, puny Thinkpad 500, which has so far seen a
montage of operating systems ranging from that biggest virus
in computing history, Win95, to Linux, TSX, OS/2 and a few
proprietary OSs. But now I feel at home. Call me crazy, and you'd
be wrong: I'm raving mad ;) and loving it. And as far as I am
concerned, the Mac pales by comparison with what I've learned about
the Atari thus far.

Gemulator 3.8 can even do MiNT (I'm still probing into how far I
can stretch v1.12 on the emulator) and Geneva 004, but not the two of
them cooperating together... Gosh, I have even set up one of the
virtual disks for the Minix fs, and it seems to work, after a
fashion.

This brings the questions: has anyone succeeded in installing
the ext2 filesystem with the emulator, and how? At the moment,
I have tried several MiNT-aware file utilities from the Umich
archive, but only TCShell seems to cope with the Minix filesystem
without translating the file names to the 8+3 format. My connect
speeds are terrible (2400-4800 bps) so if you have time and a bit
of good will ;) could someone please tell me exactly what I need
to grab from the Internet to have a full setup for MiNT+Minix fs,
the file and text utilities, editors, etc.

All right, I'm doing this for fun, but I already have a complete
quasi-OS that does everything I need, and can handle about 95 per
cent of the software I've tried, except most console-based games,
as distinct from GEM-based ones.

Matter of fact, this message is intended as a "me-too" WOW! for
Atari and a pathetic plea for some helpful pieces of advice
on how I can go on (eventually) into GEM and Mint programming
(Heat & Serve C apparently works well on this setup, along
with ETHZ Modula-2 and a few other things.) Where can I find
definitive information on GEM programming, 68k assembly, etc.?

A million questions follow:

What version of Geneva can live in peace with MiNT? Is Gribniff
still around, and do they have any new Geneva demos (I can't
cough up the bucks for the "real thing," or anything "commercial"
for that matter. I live in Russia. Nuff said,
you know... :)

What's MagiC and what can it do? I'd appreciate if you
didn't just give me the URLs and stuff: pretty useless with
terminal access and the Lynx browser. I've been there and am
none the wiser because of the word soup that ends up in the
session transcript log.

What's the best telecomms package with a Zmodem protocol to try?

Are there any offline HTML browsers for the ST and family?

Was visual programming ever developed for the ST?

Is it worth at all trying GFA Basic as a stepping-stone to
more advanced GEM programming?

What's N.AES? where can I find it? XaAES and OAESIS
limp but never really get there on my setup. How well do they do
on Ataris?

What would be the starter's one and only graphics editor on the ST
platform?

And the biggest question of all: why doesn't someone make an
operating system for the PC based on TOS/MiNT et al.? But this
is a purely rhetorical one...

Any advice and encouraging words on how to go on in transforming my
notebook computer and Pentium 200/16/PCI/Eagle/ESS into an "ST"
will be greatly appreciated :))) But no suggestions which have
anything to do with software that has the letters MS and W...s
in its name, please. I'm tired of scraping the dead bodies of
the TinyFlabby hacks off the hard disk...

Thanks in advance,
a far-gone
ayakv@glas.apc.org

paxton@zetnet.co.uk wrote:

> So ?..Ho dear... CHARGE for it then..what is wrong with you ?.. I am
> debating the profit.. not the cost

You're making the assumption that time is free, which it isn't. I make free software myself, and would be happy to see it on CD's, ftp-sites, PD-libraries etc. But I wouldn't spend large amounts of my spare time distributing other peoples work for absolutely nothing.

>>considering the price of similar CD's I really don't understand why

> haha lame excuse 2) because it is cheap.. hahaha

Read it again. Current freeware/shareware CD-ROMs (like the Walnut Creek series) cost more than a tenner, and their production-costs are a lot less than mine if I wanted to burn CD-Rs. So why should they be allowed to make profit of it, and not someone like Michael or me?

> YES BUT FOR NON PROFIT... why is that so hard to understand ?... PD

That's not a general rule. Many authors allows distributors to make profit.

> But please do NOT make profit from other peoples work.

And I ask again, what did L.A.P.D. or Goodmans do for several years? And what about ISP's and phone-companies that make zillions each year on the distribution of free software? Or the postal services, should they distribute free software for free? Hey, I've heard that Red Cross, a non-profit humanitary organisation, actually *pay* some of their emplyees!!

Distribution costs money, and in the case of PD CD-ROMs you pay for the convenient storage, the indexes, search-tools and whatever extra services the seller includes on this disk.

MiNT will probably work on some emulators, but if all you need is gcc
then get a DOS-port instead. Much faster :-)

Then why did the guy in the computer shop order it for me, and why does the manual clearly say that the AT-BUS TOS Card is designed for use with Atari ST and includes an IDE hostadapter where you can attach up to two IDE harddrives?

1560. Help please ! save screen to disc...

Well, I tried it, and just like before the system halts (see below).

> Run the Hdx.prg to partition the drive (never FORMAT an IDE!!!), an then
> the hinstall.prg to install the driver. Then reboot.

Oops...I formatted the drive on my PC to see if it was working at all, does this mean I have runined my chances of getting it to work on my Atari? Oh well...it doesn't matter. Do you think the AHDI.PRG program would have worked if I hadn't done that?

Why shouldn't you format IDE drives??

Actually it can if you have an IDE adapter board. These were quite rare
for the STF, but they did exist.

Cheers,
Nick

->energy.

I really have to agree with K.Ellis here. Now, after playing around with Mint on my Falcon, I know what I would do if everything Atari does sadly , eventually, pass into computing oblivion (may it never happen in our lifetimes!). I would buy a fast AMD-equipped clone, and install Linux on it. (and thumb my nose at B.Gates the whole time!) ;-)

There was an article in the last Computer Shopper and PC-Magazine about Linux, and its surging userbase. Seems that its over 7 million active users now, and they are rating it as the 3rd largest OS behind the Mac and Windows. Many big-name companies are porting their software to it as well. (examples-Wordperfect 7, Netscape, Doom, Quake and more). Look at it this way too...its darn-near Microsoft proof. Gates can't buy it because its free! <snicker>

Anyways, if I were you-I'd take that STe and do 1 of 2 things. Sell it, and upgrade to a Falcon/clone (like Milan). OR I'd buy the new Veloce accelerator board, add more memory, and then upgrade to Mint. Hope this makes you think a little, and helps! <smile> See ya!

Yes Gribnif is still around.

Magic is a TOS replacement.

Use CAB for online and offline access.

There are numerous ST emulators available in software. Search yahoo
for Atari ST emulation. There is Tosbox, winston, pacifist, and some
guy has coded an ST emulator in Java.

Visual Assembler.

Most any program found on a PC has a similiar program on the ST within
the limitations of the native hardware. You can also find a used ST
for anywhere from $50 to $100 USD.

We also have one of the best mail/newsreader/ftp program of any
platform called Newsie.

Good luck

B.P.

Cross-compilers exists, I know that several people compile their
Atari-programs with gcc on Intel-boxes. I don't use is myself, but I'm
sure somebody here can help you out.

VFAT has nothing to do with CD-ROMs, so that won't solve your problem
(I have been using 1.15 for several months myself). Has anybody been
able to read Joliet-CDs correctly (long filenames) with SPIN/MetaDOS?

You're right. ;)

Sounds like me and HDDRiver. I've been meaning to purchase it for a very
long time, just been hanging on to ICD's Pro stuff. Really need to change
though-need more than 64 megs for a Minix partition, and I've been told
that Mint is faster under HDDriver anyways. ;-)

Catch ya later...

Source record: 91154

I think that everyone has a right to release a CD with shareware on. It can't help nor damage the community or authors at all. If you are so angry about this CD, then why not have a go at the companys that charge sums upto £30 for a CD of shareware?? There are plenty of ads in PC format.

You don't seem to grasp that burning a CD takes a hell of a lot of time and effort, It is not a case of just dragging and dropping files onto the CD, it can take anything from One Hour to 30 minutes for the process.

You are going on about someone charging for a CD when you can download it. Yes, you can donwload it, but you pay for it. BT make money from your downloads, so what is the difference. At the end of the day, no-matter how you get the files, someone is making money.

And as for charging for time, I know for a fact that Atari PDL's made profit from selling PD. DOn't say that they don't charge for time, of course they do. WHy do you think people set-up PDL's in the first place?? As a hobby? Maybe to start as, but both Goodmans and Floppyshop were out to make money. As simple as that.

If you are against profit from other people's work, then like I said, go and moan at BT! GO and moan at the companys that charge £30 a cd!

Thats all I have to say

Jos, this time you managed. Told you some months ago to check the editor you're using: it should NOT break the header lines when you start to write/reply. If you set your editor to wrap lines, then upon loading the text for NEWSTEST.TXT it will break the header lines... NO GOOD!

So set it at no wrap at all, or if you can define separately between "inserted" and "allready written text in the file", set ONLY wrap for "inserted". A decent texteditor (like QED) can do this.

If you can only make an option for no wrap at all, you'll have to take care of the inserted text yourself: wrap at max. 75 chars!

Furthermore, DON'T rename files the editor wants to create to other names!

That should do the trick.

Do not worry. I made a completely total crash and shredded all data
on my MiNT bootdisk (a 44 Mb Qyquest).

I figured out why I hope:

1. no good SCSI cable.
2. when auto-folder programs are loaded: is there any check on data-
integrity? It seems not.

Otherwise: how to explain that the write of the log-file by AutoMore
overwrites boot- root- and mny other sectors even while HDDriver has
them 'write-protect'?

I use the BJ10ex canon injet printer with my ste 520 by using NVDI 5, but it
woks without NVDI you can set the dip switches to epson mode and most
ST software will work with this setting. I think a colour printer will need
NVDI though, actually I haven't tried my Canon 4200 colour printer on the
atari, I would be intersted in any commnets too

Do you still have access to an Atari? If so, then the program TUC111
includes a Write On to RTF converter. Or if you have anyone with That's
Write 3 then it can load the files and output them as plain ASCII,
though that will lose all styles etc.

If you don't have Atari access, email me at xlator@cix.co.uk and I'll
see if I can do the job for you (if it's not too big).

Regards
Peter

That's not the argument atall. A small and reaosnable amount of
recompense for the *time and effort* spent on making the CD is OK.
Charging a few pence for the time it costs you copy a floppy is OK, 10
quid is obviously more than reasonable. Your defention of profit is
clearly one in which time and effort are not given monetary values and
accounted for as costs, mine is.

You can fit 650 MB of data on a CD so I'll answer that question instead,
the answer assuming a reasonable 3.5KB/sec is just under 59 hours, at
the weekend's with BT in the UK and assuming you subscribe to
Premierline & F&F discount schemes that'll cost you almost 40 pounds
just for the download, now you need to buy 650MB of storage space to put
it on. 100 quid for 650MB SCSI HD's filled with Atari software anyone?

I am looking for a color monitor for my Atari 1040STF. I am currently using
an SM124, but I can't play games or anything on it because it is monochrome.
If there are any offers, please mail me at chris_103@hotmail.com

Thanx!
Chris Taylor

> above.

Ok, well that is your decision whether or not to charge for a game. It is your program you can make it freeware if you wish. Some authors want to make a couple of bucks though, and they release it as shareware. So.. what's the difference between a programmer wanting to make a few bucks or a person who is putting together a CD?

> ** I will NOT ask them to pay me for the six months time it took me to
> make it!!! **

Yep, but some programmers will.. which brings me to my point: There is no right or wrong answer, it just depends on your moral and ethical believes. The old saying that "opinions are like ass-holes, everybody has one" is very true.

> Get out of that :)))) Someone please explain to me why people putting
> together a CD of PD and FREEware can charge for time, but people
> making PD and FREEware software can't ??? I am at a loss....

They can. If the author wants to charge for their product they can. Its only PD/free ware because the author chooses it to be in that state.

> I am NOT against profit... blimey how do I say this so everyone

> back.. that is NOT profit...

My point is that this is very time-consuming, and since collecting,
cataloging and distributing is *my* work, I can't see why I can't
charge some money for it.

> For the LAST time.. I am not apposed to charging for a CD, I am not
> apposed to the cost of a CD, Be it 5 ukp or 50 ukp.. whatever it costs
> then you must get that back..

...but not the time spent, am I correct? What if I hire a couple of
guys to do the work for me, but not keeping a penny for myself? Then I
won't make any profit at all, I just get back whatever it costs. This
is what the large PD-companies has done for a decade or so.

> Please STOP quoting how much it costs to make the CD because I already
> told you that is fair and correct to charge to get that back... its
> the.... ho sod it.. your not even paying any attention are you ?...
> sheesh perhaps if I draw you a picture? will that help ?

Perhaps I should draw YOU a picture, or perhaps SOME SHOUTING will
help? Don't you see the difference in charging money for a product,
and charging money for the *distribution* of the same product? Or
charging money for the catalogs, indexes, databases, search-programs
etc. that might be included on a PD-disk?

You can browse with CAB 2.7 demo, the only very slightly irritating
thing is the 15 second wait when loading/quitting. I'm only really
using CAB 1.5 now to add/delete to the hotlist.

It might be worth staying with Newsie 0.90 ftb as there have been
problems with 0.92, I, as well as others, can't use it as it locks up.
We have had e-mail discussions with John about it.

> :(

You serious? A couple of quid for a floppy disk & a stamp?
Maybe a higher profit on a single floppy as opposed to a single CD but
you seem to be forgetting that a CD holds about 1000 times what a floppy
holds, a PD library would only have to make 1p profit a disk before they
would make more profit than the *TOTAL PRICE* of a tenner CD. I knew
someone by me who ran one of the smaller PDLs, I think he sold disks for
about a quid each, he told me he was raking the money in from it.

> blah.... thats plain childish :(

It's not childish, it's a sensibe argument, someone somewhere is
always making a profit no matter how the software is distributed why
is the person who puts it on the disk any worse than the people that

deliver it to your door or the ISP that charges you to download it or
the phone company? Tell me what the difference is instead of just
saying it's childish.

> Lets suppose you release a FREE or PD title and the next day someone
> says to you that they are going to package and sell it for a profit
> and your going to get nothing... is that right ?... no it is not,

In the case of a CD then yes, to me that's fine, I'd let them do that as
long as I felt the retail price was reasonable, charging a couple of
pence a megabyte is fine by me. If they stuck it on a floppy and tried
to sell it for a tenner then I wouldn't like it

> well
> that is exactly what CD compilers are doing but its not the next day..

Some of them are, Tucows for a start.

> IT STINKS.. but because you are suggesting making a smaller profit
> then you think thats better than the ones making 20 or 30 ukp a cd...
> think again :) small profit or big profit theres no difference.

To you maybe. I don't recall you having a problem with PDLs before
though.

I have been using SPIN_SD.BOS with Metados for the past week or so, when I installed my SCSI CD drive on my Falcon. I have burn 1 CD with uses the Win95 style long filenames, actually it was done in 4 burn sessions. The funny thing was that I can read all sessions on my Falcon and on my office WinNT, while my home Win95 PC can only read the 1st session now. It was able to read the 3 sessions before I burn the 4th session on.

The long filename comes out as ~1 on the MiNT system. The reason for that is that the MiNT I am using is 1.14 and not 1.15 which have VFAT support. Mmm... I think I will try that tonight.

Metados can be found at http://www.oden.se/~dlanor/

I didn't say it was. I asked you a question, pay me 1p to distribute
and make a bit of profit or pay 50p to a floppy disk company and the
post office and both of them make money from the transaction, which do
you prefer?

> >I don't think you can speak for the views of anyone but yourself, I

I honestly don't know, I don't think they would object to a PDL selling
it for a coupld of quid and making far more money than I would.

> The above is the whole essence of my side of the "debate", you stating
> its only a small profit, you stating its a bargain and you stating
> others do it are all lame excuses that I pre-emmpted, the simple truth
> is that authors released there work for FREE and up pops you with a CD
> writer and decides to make a "small" profit from there hard work.:((

You continue to neglect to mention that this profit is purely
hypothetical in my case considering the amount of money it cost me to
collect it all and the fact that no matter how you distribute the
software SOMEONE is making a profit out of it and if I stick it on a CD
then the costs for everyone are pushed right down.

> >distributed under the GNU system, people that want their software to be

> And your point is what ?... are you suggesting that because some
> people are happy for there free software to be sold and made a profit
> from then everyone should be ?.. is that your honest opinion...

I am simply saying there are a hell of a lot of people out there who
dedicate huge amounts of time to things like Linux and they are only too
happy to see people shifting Linux distributions and getting their
software out to those who can't justify downloading it. You say it's
wrong to sell freeware, I'm saying that a lot of people who believe in
free distribution and open source projects aren't sharing your views.

> we should all be happy to let others make a profit from our work
> because someone else does ?

No, if you aren't happy then that's up to you. It's not about YOU, your
software was never going to be on my CD, I'm talking about the wider
picture, your personal opinion isn't really relevant, I have to
speculate how the vast majority of people feel and I don't think they
agree with you. That said, I think your feelings are made based on
emotions as opposed to objective reasons.

>...Not a brilliant reason for stealing from

Deadly serious, however you seem too eager to dismiss it without
thinking about it.

>.. BT, Post office making money out of my
> work... Like I said.. why not the road sweeper..

Not the road sweeper because the Post Office would still be delivering
your letter even if there were a few fag packets on the ground, without
the PO it doesn't get there atall. Address the point I made, why is it
OK to pay them to distribute your software but not me?

> or hey what about the
> road sweepers local pub... he cleans the roads that the post office
> uses.. he spends his money in the pub, the pub landlord has a
> computer, the computer industry has a customer because he makes money

> making really sad and lame excuses now :((

It's not an excuse it's a question which makes a point you are doing
your best to avoid. Whichever way you cut it, people are making money
by distributiong your software, FACT.

> BT makes money from my freeware hahaha get real ..

Of course they do. If I want to get your software, I can't buy a CD
with it on, my only real choices are find a PDL that has it and pay
them, maybe send you an SAE and disk ot downlaod it from the internet.
All of which involve people profiting from the transaction and costing
the end user a lot more per meg than a CD would have cost :-(I don't
see how you benefit either way, I see how the end user loses out not
having the option of the CD and the CD maker-it depends.

Hi friend:

Geneva will run with Mintos KGMD but will not be very stable, I tried. For that you need Naes and THING desktop which will make it super stable.

With MINT you can run on the vconsoles many ported Unix applications like Pine (for mail) Lynx for www and FTP and do Telnet. IRC etc.

an> Why shouldn't you format IDE drives??

he meant low-level format...It destroys the head positioning data on
the
drive. Most IDE drives will ignore this command or just send back a
COMPLETE
signal without doing anything. Some older 20-40MB IDE (the vert
first ones)
did except this command. You can re-format an IDE at the OS level,
just not
at the BIOS level.

1620. Atari 520ST

Newsgroup: comp.sys.atari.st
Date: 1998-10-27 00:00:00 UTC
From: Tony <treis@blazeinet.com>
Message-ID: <aAdZ1.675$Z5.865@typhoon.mbnet.mb.ca>
Source record: 91234

I have an Atari 520ST with external disk drive and the SC1224 color monitor
for sale. It features MIDI in and out ports for the musicians out there.
Accepting any reasonable offer.
You can reach me at treis@blazeinet.com

Sincerely, Tony

1621. FS: Falcon/MIDI/Audio recording system, complete

Newsgroup: comp.sys.atari.st
Date: 1998-10-27 00:00:00 UTC
From: psalad@earthlink.net
Message-ID: <713ojc$e9k$1@ash.prod.itd.earthlink.net>
Source record: 91235

FS:

-Atari Falcon, tos 4.04, 14 megs RAM, 0hd, clock and audio mods done
(all/most original docs, box, mouse, etc).
-Steinberg Cubase Audio Falcon 2.06 software with all manuals, dongle, etc
-Steinberg Studio Module, Cue Tracks, Style Tracks software bundle
-SoundPool ADAT interface, 8 inputs/outputs on lightpipe
-SoundPool mixermaps for Korg 168RC digital mixer
-Steinberg (SoundPool) SPDIF interface, upgraded to 20 bit capability
-Steinberg ST-MIDI3 1 input/3 output MIDI expander for the Falcon
-Screenblaster 2 software/hardware
-NVDI 3.x
-Diamond Back, Diamond Edge software
-HDDriver 5.x
-SVGA monitor adapter

More? Whatever Falcon/Atari stuff I have otherwise..

I will include an iso9660 (dos) CDR disk with the setup info on my C: drive,
so even though no hard disk is included, you could easily (and cheaply) buy a
SCSI drive and load my setup to get up and running immediately.

It is with some reluctance I place this ad on the newsgroup.. I don't really
want to sell, as this system has served me very well over the last however
many years. However, I recently replaced this system with a Mac, which seems
to be working so far... :^}

I would like to sell this entire system as a package, and will accept a
reasonable offer. I am realistic as to the real world value of this system
(even though I probably sunk $3.5k into it originally.. money well-spent, as
I got quite a bit of use out of it).

Email me if you're interested...

I would check 2 possibilitys first:
- Is your hardware clock set (correct date and time) some of the bootup-
applications need a correctly set date (especially some of the network-daemons).

- cbhd seems to cause trouble with MiNT in some cases. I was unable to
track it down, but some Processes (including the login-process) are crashing
with cbhd :-|.

- What Hardware-Setup do you use?.

- Could also be a trouble with an acc or with other apps in your auto-folder.

- You should run MiNT without Memory-Protection (Kernel needs to be
named "mintnp.prg").

Please answer by mail, because I'm not reading this group very regularly.

If you have an AT-BUS TOS card the guy in the shop was absolutely right,
i. e. you can connect an IDE drive to your Atari.

Well, this is strange. If I understand correctly, you can
- boot with 2.06, without the drive,
- boot with 1.00, with or without the drive,

Have you tried running AHDI from TOS 1.0 ? I'm not sure if it supports
IDE drives, so it might not work at all.

The other option is to check that the board is correctly installed. It
probably has wires soldered all over the place. Have you checked that
they are all ok ?

> > Run the Hdx.prg to partition the drive (never FORMAT an IDE!!!), an then

> well...it doesn't matter. Do you think the AHDI.PRG program would have worked
> if I hadn't done that?

It depends. Do not mix up formatting (what is stupidly called "low level
formatting" on the PC) and partitioning ("formatting" or "fdisk" on the
PC). You can partition an IDE drive as much as you like, but never
format it.

You probably partitioned the drive, so that shouldn't be a problem.

>
> Why shouldn't you format IDE drives??

Because some drives keep their system specs on the disk surface. When you format it, you erase this information. You should only reformat an IDE with a utility provided by the manufacturer. There's no point in formatting a drive anyway.

Cheers,
Nick

Hi Nick,

there's several ACC's that do the trick thru' ALT-HELP. Much of 'em in old formats, but also several that write into IMG formats. I recall there are autoprograms doing the same.

The bloody thing AFAIK is that Cubase 2 doesn't like ACC's. I've been trying years ago and I found that Cubase needed a clean environment, i.e. no ACC's or only some selected ones. Also had to remove several auto programs to get it running.

I can email some stuff, but I need some time to dig them up from the archives :-) Just lemme know.

Jo, I'm not familiar with MagiC 6 (yet) where it *may* be possible, since MagiC 6 enables you to choose the icon fonts too.

Could be it's been done from Jinnee: this one let you select the icon fonts, color and has an option for transparent icon labels! This is one of the best features that should be brought into Thing too (Hi Thomas!).

So if you don't specify the label's text and have the label itself transparent it won't show up... that simple.

Tell you, it really makes your desktop looking better, having those little names without a bloody white label on the screen. Especially when you can select the fontcolor too :-)

But the fact is that they *do* make a profit on the distribution, and
it appears to be OK by you. So I ask again, where do you draw the
line? Is the CD-compiler any worse than the ISP that rents out
ftp-space where PD/shareware (and very often pirated commercial stuff)
obviously is distributed? Why is it so bad to make a profit on the
distribution only when it's done by a private person and not some
company?

Hi Paal,

you have to put FPU_3.PRG (or whatever version U use AFTER MiNT.
Both PhotLine (TT version) and Texel use the FPU thats why they
complain.

greetings, janne

If they have, it would be illegal software. Cubase for Atari, although not actively supported by Steinberg at present, is still available new commercially, and can often be found second-hand at reasonable prices.

There have been the first whispers that Steinberg may one day produce a version of Cubase for the Milan. At present the company say there is nothing planned. I would like to see that change, but I am sure they are less likely to support our platform if they see even more cracked versions around.

This news-group has had some heated debate recently about the rights and wrongs of C.D's of freeware etc. I hope we are all as determined to support commercial companies who still supply excellent software for us.

No, I do not work for Steinberg !

From what I understand, the two keyboards are relatively voltage-compatible.
The problem comes in remapping the keys. There's a DEC hack that talks
about this to some degree. I wish I had more data about the ST keyboard.
Perhaps some research is in order.

1648. Atari SX212 Modem

Newsgroup: comp.sys.atari.st
Date: 1998-10-28 00:00:00 UTC
From: ALF <ethernyet@aol.com>
Message-ID: <719066$b6b$1@supernews.com>
Source record: 91012

Hi, I recently acquired an Atari SX212 modem without any manual, software, cable, or power supply. I was wondering if people out there had info. on this modem? I'd imagine I could get a generic A/C adapter, but I don't know the voltage. Is it Hayes compatible? Is the AT command reference & default config. info. online somewhere? Also, it appears to connect to either an 8-bit or 16-bit Atari machine? Finally, by the"212" moniker, I presume it is a 1200 baud modem?

Thanks a bunch, everyone...

The regular Atari's can NOT handle IDE drives no matter what you do. They only use the RFM/RLL or SCSI (with a LINK I or II) hard drives or CD Roms.

Maybe I should have made myself a little more clear (I did this with
Tony in a PM). I would expect, at least for the project that I had in
mind, only to charge for media and postage. I would have only
distrubited the CD's for a hobby (non-profit). I am going to create my
own CD reguardless, and while it would take some time to burn in an
additional quanity (#=?), I don't plan on producing a professional CD.
I have many disk based floppys and apps that are nearing 10 years of
age or better and for the sake of not loosing them to time, am going
to put them on CD. My only question is what would the current owners
of ST Informer, or previous owners of ST Format, Current Notes (the
latter three owing me about $200.00 in non-delivered subscriptions)
and other past magazines have to say about this. I'm not going to
waste my time contacting every shareware author to see if they still
wouldn't mind their works being distrubited on a non-profit CD, nor
would I spend the time looking up past publishers. The CD would have
no title, no jacket and no real directory structure. Just a back-up of
old floppys (and maybe some hard to download-megabyte files) that
modem users may have trouble getting as well as some of my favorite
archives (NOT COMMERCIAL).

Anyway, it will be a winter project. Something to spend time on using
my Atari.

1652. Re: MiNT on PC

Newsgroup: comp.sys.atari.st
Date: 1998-10-28 00:00:00 UTC
From: Alexander Yakovlev <ayakv@glas.apc.org>
Message-ID: <APC&63'0'5b6bee43'651@glas.apc.org>
Source record: 91097

Hello Petr,

You wrote on comp.sys.atari.st:

>Does anybody know How can I run MiNT (or GCC) on a PC with some
>ST emulator?

I have succeeded in installing MiNT on Gemulator 3.8 (available
for free at the www.emulators.com site, as a "junior" version
of their commercial software). I have even managed in setting
up a Minix filesystem as one of Gemulator's virtual hard
drives. So if you are interested, get this emulator. In contrast
to it, the *much* slower PacifST can run games, but has some serious restrictions.
If you need, I could reproduce for you the steps
I made to set up that whole thing. For now, I haven't tried
GCC on it, but it appears that it may work. Alternatively,
you could go to the Umich archive or its mirrors (I "graze" by ftp or
http://src.doc.ic.ac.uk/packages/atari/)

You might also want to get Geneva (a mutitasker) from the same
site in the Mint/* directory. You will also need the file, shell,
and text utilities for a MiNT shell like tcshell, built for
MiNT, in order to run GCC, and also the tar utility and
gunzip in order to decompress and install GCC, MinTOS, TOSwin, etc.
(also available from the Umich and Paderborn archive.) Also
get the MinixFS driver and source from /packages/atari/MiNT/Filesystems/*

I myself am new to Atari emulation, but am putting my nose to
the grindstone, and am hacking a lot.

Hope this helps.

Listen, Anton has got an AT-BUS IDE adapter board. I doubt anybody would
start selling IDE adapter boards for the ST if they didn't work.

There definitely are several internal IDE board around for the ST. I
know of at least the "C'T project" one, the AT-BUS one, and the TUS
IDEal for STE only.

What you DO need to use IDE drives is TOS 2.06.

Now, I believe Anton's problem lies with the board itself, since the
drive is ok, and he can boot both TOS versions. TOS 2.06 checks for an
IDE drive, and hangs, whereas TOS 1.0 doesn't check.

Maybe someone here with a similar AT-BUS board or with the installation
docs could help him check the connections.

Cheers,
Nick

1657. Wanted: Your Hardware Hack Experiences

Newsgroup: comp.sys.atari.st
Date: 1998-10-28 00:00:00 UTC
From: David Jackson <anderon@ix.netcom.com>
Message-ID: <716kjv$6ak@dfw-ixnews9.ix.netcom.com>
Source record: 91102

I have recently returned to the Atari ST scene. I fried my last Atari due to misreading the German documentation on a hardware hack about 6-7 years ago. Now, I find myself in possesion of TWO Atari STF machines, with working monitors. And, an Adaptec SCSI host adaptor. But, that's about it (no external floppies, no harddrives).

I got the machines because I love the old Atari. After using Windows for so many years, I now consider it a superior platform, for many reasons which I won't go into now. I wanted to return to my hacking roots, and since there's a wealth of hardware hacks, these two machines would be perfect to tinker with.

Since my last experience with a hardware hack was fatal, I would like to hear the experiences of others who have performed some of these hacks. Which ones worked, which ones worked best, which ones are in the range of "can't live without".

I appreciate any input...

David

Same as usual: check the connections of the mouse connector to the
keyboard PCB. Check for dry joints, crack in solder. Re-melt solder with
a soldering iron.

Or: broken filaments in mouse cable, try bending/twinsting cable to see
if changes anything, eventually change cable or mouse.

The ET4000 is a graphics card that should allow VGA resoultions. Not sure on which machine it goes, but I'd guess it would go into a Mega ST or Mega STE.

The Pak030 is an 030 accelerator board, but pretty expensive IIRC. It would probably be cheaper to get new Milan.

Hi.

I'm going to replace my internal 65 Mb IDE HD with a bigger drive. Is there any pitfalls or special things to check or is it just to plug in any IDE drive, partition it and start working.

My setup:
Atari Falcon AB040 in Mk-X case.
HDDRIVER 7.5

/Jonas

1663. Re: Help fix my mouse

Newsgroup: comp.sys.atari.st
Date: 1998-10-28 00:00:00 UTC
From: Steve Rollinson <rollinso@infobahn.com.au>
Message-ID: <36371448.AFD2B537@infobahn.com.au>
Source record: 91108

Have you tried cleaning it?

Mouse balls get dirty and pick up lint - being dragged arround a dirty desk all day etc.

Gently remove your mouse ball, you may want to wash it with some warm soapy water and dry it carefully.

Check the rollers inside the mouse. They often get a build up which prevents them from turning smoothly (or at all).

Gently remove anything from your mouse rollers that doesn't belong there. You may need to use a little alcohol on them. The two real important rollers are the front and side rollers which are used to trigger the mouse movement. The rear diagonal roller is used to keep the ball in place.

You can also check tosee if your vertical movement is working by using your finger to rotate the front roller. If you can rotate the roller but the mouse won't budge, you have a different problem.

The electronics in the Atari mouse is simple. Pin wheels interrupt optical sensors which are used to switch comparitors (a single quad comparitor is used I think) which then toggle the control lines.

If you have continuity from your mouse connector through to the tracks on the PCB then the problem isn't there. You can also check to see if the comparitor is being driven by measuring the input and slowly rotating the pin wheel.

regards

Steve Rollinson

Just make sure to order a 2.5" IDE, not a 3.5" drive.

In fact, you can buy adapters to convert a 3.5inch drive for use on a 2.5inch socket. Of course, it means putting your Falcon in a case, but 3.5 inch are cheaper.

So BT, the post office, floppy-manufacturers, Demon etc. are all
immoral thieves and pirates that makes profit on distributing free
software.

The XFS for CD-ROM is spin.xfs, and on my system it can't read the
long filenames on Joliet CDs :-(

> I also installed SPIN 0.34 for MiNT and it can see all the long filenames and
> the Upper/Lower case of the filenames as well. I will be sticking to SPIN now.

I have the same setup, but SPIN can only read the DOS-names... It
could be a problem with EasyCD Creator and this specific Joliet-CD.

The Panther (and Panther 2) fits all STs, I'm not sure about STE.

Agree, a Milan will be faster and probably not more expensive than a
PAK/FRAK/Panther upgrade.

I'd say get a 3.5" instead of 2.5", they're a lot cheaper and faster.
2.5"->3.5" adapters are cheap and sold by most Amiga- and
Atari-dealers. I believe Wizztronics have a complete kit for fitting a
3.5" inside a Falcon.

No, but if he released it as freeware he voluntarily gave up his
right to get paid. Since he still holds the copyright, he can still
restrict reproduction and distribution.

Actually, he said he had a Mk-X case, so room for a 3.5" should not be a
problem. He will need a simple 2.5" to 3.5" adapter though, since the
connectors are not the same.

Unique artwork for sale!

Bob Wakelin is the artist who illustrated nearly all the covers for Ocean software between 1983 and 1994. His work includes the covers for Rainbow Islands, Match Day 1 and 2, Parallax, Head over Heels, Parasol Stars, Chase H.Q., The New Zealand Story, Hyper Sports, Pang, Where Time Stood Still, Moon Alert, Operation Thunderbolt and Target Renegade.

Now he is selling his original artwork that was photographed for the box and inlay. Details (and about 30 box scans to remind you of his quality work) can be found at:

http://retrogamer.merseyworld.com/wakelin.htm

An interview with Bob Wakelin can be found in the current issue of RETROGAMER fanzine (number 18).

Thanks for reading,

now one of the BEST ones I ever saw regarding refinishing was at
ACE '95, at the Systems For Tomorrow booth. Someone had taken their TT
and turned it into something the Flintstones would compute with, using
a granite-finish "speckle-stone" spray paint and clear topcoat on the
case and keyboard casing. He even went as far as to carve a new raised
TT logo for the case.

Hi

I hope this is of help.

Of what can see there are 2 common problems with the humble rodent: the first is that the rollers get dirty and I rockon should be cleaned regularly (once a week or something like that), when cleaning the rollers use a NON metalic screwdriver (I use a trim tool when I do mine.)

The second cause is down to Atari's lovely design of mouse ports connected to the keyboard. These have a habit of becoming loose from the keyboard PCB due to the pulling, pushing and the general hammering. This is the most fiddly fault as Atari didn't give the ports much support to the sockets.

BE WARNED, there are lots of rubber caps when you dismantle the keyboard and I would advise that you try and prop the keyboard up using couple of books; so that the keys are facing down and the underside is facing up. This was the keys will take all the rubber cups that are loose down with them.

Once they are safely to one side you can safely re-solder the connectors to the motherboard.

If you find that you have 2 cups missing, you may find they were never there in the first place: the RETURN key has a plac for 2 cups, but only uses 1. On some boards there is an additional space for a cup, but it doesn't have a corresponding key.

The first time I sorted a keyboard out with that problem, I had the kitchen carpet up, washing machine moved everything looking for 2 cups that were never there in the first place. I wasn't expecting the rubber cups at all.

If I can help further, don't hesitate to contact me.

Hi

If anyone is chucking out any of the following, I would be grateful if they could chuck them my way, as this would enable me to help support other Atari machines.

Falcon, Mega ST, Mega STE's, Lynx, Lynx II, STacy, TT and not forgetting 8-bit Atari's or any unusual Atari hardware. At present I can only help with Atari's ST/F/E's etc., Jaguar and I'm looking into Portfolio assistance.

At present I only try and cover my costs as I class this as my hobby, so I have a very limited budget. Who know what the future may bring.

1692. AFTP/STing prob

Newsgroup: comp.sys.atari.st
Date: 1998-10-28 00:00:00 UTC
From: tos4ever@ping.be
Message-ID: <36376f842f8a8d1@ping.be>
Source record: 91137

Hello,

I just ran into a strange problem with aFTP 1.4b3 Sting version.
I can access every anonymous ftp site but I just can't access the
ftp-server of my ISP (password and logID required)

I always get this: Can't bind data socket.

My log file says this: Can't open passive connection: Permission denied

Any idea about this.

BTW: When I use my usual setup, MiNT/MiNtnet/aFTP (MiNTnet version) I can
access that ftp-server without any prob.

Hello,

I have found a Falcon with a SVGA card and monitor, syquest external HD. The machine has 14 Megs.
I found it for US$ 535. Is it a good deal?
Should I wait and get the Milan instead?
Are they both compatible with my old ST software?

Thank you!

Nope, it's commercial.

Contact System Solutions, as they are the UK stockists...

It's deffinitely worth getting, I can't go back to using an Atari without it now!! :)

1695. For Sale FALCON (Canada/US)

Newsgroup: comp.sys.atari.st
Date: 1998-10-28 00:00:00 UTC
From: Ian Richards and Andrea Ryde <dblbass@home.com>
Message-ID: <363761B0.703EEDCB@home.com>
Source record: 91140

For Sale: Falcon, Blowup FX, 850meg, TOS 4.04 etc.

Lots of software on drive, Blowup FX is a little unstable. Using larger resolutions and extra ram seem to work fine although the system accelleration seems flakey (I have not tried any of the extra fixes that may make this more stable.

$$$ 400 US including shipping.

PS: will include many extras such as cables, both monitor adaptors, etc.

Chris, you appear to be in North America, so I'll recommend the Goodwill. You should be able to find an SC1224 or a Commodore 1802c there for $20 or less.

But if you can locate one of the old boxes (someone will hopefully tell you the name of it, I can't recall right ATM) that plugs into your monitor port and brings out direct audio and video to RCA jacks, you can plug that into any TV with audio and video ports - it's good enough for games. No good for anything that uses medium rez, but low-rez should be dandy.

And the other people are talking abou Shareware as well. But I am not bothered what you think at all. I replyed to a posting that was going on about Shareware (From Bengy Collins) and I had something to say. You come along, and start giving me insults. Infact, I don't know who is the silly one here. The one who started it, or you. But the last word on the subject is, if Paul Womar wants to sell CD's for a tenner, let him. I agree it's a sensible and fair price.

So, get down from your soap box, and give it a rest. It's going on and on, it's boring me, and it's a waste of time.

Oh, and stop being childish to me bye deleting me from the ST+ mailinglist every time I subscribe. What's the matter? Don't like the fact I know an ex-st+ member?

1702. New Multi-format magazine

> the STs minix filesystem.

I would like to know more about this myself since I'm attempting to do the same thing using TOSBOX (I have it configured correctly so it's running more or less as a TT clone).

Could KGMD be installed without turning any partition into a minix one? I'll only repartion my drive as a last resort...or at least find a second hand HD drive to use just for that.

And how about getting it to read VFAT/FAT32? I think the latest versions of MiNT or MiNTOS could do that...

(And if you must know, I am trying to turn my PC clone into a real Atari TOS computer...until I can finally have enough saved for a Milan :)

>(I have been using 1.15 for several months myself). Has anybody been
>able to read Joliet-CDs correctly (long filenames) with SPIN/MetaDOS?
>

You are right !!!
I installed 1.15 last night and enabled VFAT, NEWFATFS etc etc but nothing. It cannot see the long filename, still comes out as ~1. I figured that it is the XFS which does the I/O and Mint only contains XFS for floppy & HDD.

I also installed SPIN 0.34 for MiNT and it can see all the long filenames and the Upper/Lower case of the filenames as well. I will be sticking to SPIN now. Even the music CDs.

I am sure your configuration is correct but here is a brief of my config:
Both SPIN_SD.BOS & ISO9660F.DOS are in my config.sys file. I am loading the METAXBS.PRG before MiNT (there is no need for metados.prg). The SPIN.XFS is in my multitos subdirectory. My shell is Thing v1.09.

I can't, really... what would a stupid card with 16 megs go for these days?

If you can't recall seeing metal shielding, it has the "spray-paint" shielding inside the case. Therefore not an early model.

Hi J.E,

don't we see this kinda discussion twice a year, or so?

As far as I recall, the last one ended up nil-nil, so this one will end up nil-nil. I seem to recall telling Paxton the same on this website program thingie.

C U guys next year, the first one JES - Paxton, returnmatch Paxton - JES unscheduled, both will end nil-nil...

at least it keeps the flow going...

And all this of course with one BIG :-), before I'm banned...

Eric,

Stop whining and just enjoy the machines, will you? Atari computers are
going to
be great collectible machines and enjoyable for their own sake. We have
have a
lot of great folks in the community that are having fun with the hobby. We
all use PC's
at work but Atari computers are fun to play with !!! Can't you just leave
it at that?

<VERY LARGE CUT>

WHAT THE FUCK DO YOU ALL THINK YOUR DOING!!!

if you'd all look at what userbase the pacifist has, or tos2win or tosbox
just to name some, i realy resemble the thought the 'atari' users are
spitting out these ppl because they "DON'T" own an atari... well, most of them
DO or DID own one, just like Mrmaddog, i hope he will turn to ME if he has a
problem in the future, coz frankly i hate ppl that neglect others...

MrMaddog, talk to me [NUT] if you see me on irc, i don't 'simpathise' with you
i am just at your side...

Hi,

I'll be posting several Atari and non-Atari Items for sale soon. However before I did that I wanted to post the largest item I'd like to sell, swap, etc.(based on replies I get)

1 SLM-804 Printer. Works great and in very good condition except that it does need
new toner, and possibly a drum (it developed a small scratch on it when a piece of paper
was inadvertently placed in the paper tray with a paper clip attached to it). I'd prefer
that the person interested pick the unit up at my home (for obvious reasons). I live in
the metro New York area.

Thanks !

I have always thought of Mr. Paxton, in the year I've been reading this newsgroup, as one
of the many helpful Atari folk. But, I must say after reading the thread on the new Atari CD and the my last post thread, he has changed my opinion 180 degrees. "Grow Up"
Mr Paxton you are not nearly as important as you seem to believe , nor are you even
close to polite when someone does not agree with you.

Well all I have to say is this..
I challenge anyone to go to dejanews, and just look up Tony's name on
c.s.a.st
And you will see that he LOVES to argue, and finds things to argue about
just for fun (even if they don't exist).
Now I know a News group is suppose to be about discussions, and
arguments...
But I mean come on.. Tony, if you're reading this.. Im very sorry but I
cant stand reading your posts anymore :) Im not being mean, it's just your
language you use really annoys me.. words like "ho" and the way you ..
hmm.. how do you put it.. you write as if.. you are superior to every atari
user, and every person on this earth for that matter.
Well, that's my opinion. Im not participating in any Threads started by
Tony any longer.. they go absolutely NO WHERE! :)
Bengy
btw, I updated the MagiC site a bit today :)

1719. New canadian Atari dealer?

Newsgroup: comp.sys.atari.st
Date: 1998-10-29 00:00:00 UTC
From: Bengy Collins <collins@bulli.com>
Message-ID: <36392519.DC3C0FCE@bulli.com>
Source record: 90955

Hello,
I've been considering opening up an Atari shop here in Canada, since now with computer direct gone, us Canadians have to either order from the States or the U.K.. and with our dollar being so low right now..
The question is.. maybe computer direct closed for a reason. Does any one feel there is a need for an atari dealer? Do you believe an atari dealer could make enough to just stay in business ? (I really don't care about making a profit, its mostly to provide a service and help keep atari alive..)
Of course it would be mail order only, so I wouldn't have to pay rent or anything.
Well I guess if I do decide to, and if it totally fails.. the worst thing that could happen is I would be stuck with a bunch of Atari stuff!
Its a win win situation :-)

>they would "bin it" sight unseen , people questioning if I could even
>finish the project, people telling me to learn a new language and like
>maddog says..people telling me to get a new machine..
I didn't see any clear attacks. Obviously you did. Either I am blind
or your are way too sensitive and seeing things that are not even
existing or that you just create all by yourself coz you have too much
freetime. (getting mean here I agree).
The one snotty about this whole thread is you attacking at some level
that should never be reached.

>>Some people are trying to brake their ass off to make atari just "OK".
>
>Yes whats wrong with that...I am not looking to blow people away..
>just make some software... a hobby is a bit of a naff hobby if you get
>attacked for it ?
Where is the attack??? I really can't understand.

"silly halfmeg". How could you consider that silly. Probably sarcasm
here. But ain't working.

>What ?...My last game was made for and tested on a TT and the one
>before that for Falcon..and all made on my STe... perhaps you should
>get off your high horse and check your facts before ranting about

>5320st ? It must be 5 years since I made a half meg game.....Your not
>usualy this brainless....
hmm here is 1 attack that you never even get the chance to get from
your imaginary opponents.

>
>>already getting elitist in the way that the 520 is plenty, a wonderful
>>machine, that you don't need a falcon or hades as your 520ST can do
>>everything you want. (not even stating that you have a pc).
>
>Ho here we go.. how childish.. I have told you before.. I have had a
>PC for over 5 years and I am not one of these get a PC + emulator and
>think they are still atarians.. you really are suprising me today....
More attacks. free ones too. Did my post say that I deny any pc users?
No I just don't accept to enter an era ruled by pc. Not saying
anything else.
Please read. If you can even analize what people write, you might
discover the real meaning of the messages. (getting mean here again).
>
>See what I mean.. utterly pathetic of you this... Five years I ahve
>had a PC... please dont lower yourself like this... it really is
>embarresing
Another attack. Oh well. That's ok. getting used to, after the 3
others before.

>I have always had a great deal of respect for yourself and what you
>do... Hey I even wrote a full page about your work and web page for
>ST+ a few weeks ago
>
>But to see this ranting.. to see you make pathetic attempts to point
>out I own a PC... well to say I am suprised is an understatement..
the only thing said: "all those fancy big atari blah blah, (not even
talking that you have a pc)" So, as opposed to all those "fancy"
things.
Ok, WHAT IF I DO have a pc also? I bet that'll throw you off?
Would that change my too narrowmind of mine? If I had a pc, would I
be saying all what I said?
>
>I have a 4meg STE
>I make software for Falcon and TT and all ATARI ST' including megas
>I make software that runs without any fixing or backwards on falcon
>I have owned a PC for 5 years..
I, I, I, I, hey man. chill out. taking things a little too personal
or maybe a little too narcissist?

>
>Pathetic to try and make me look bad for having a PC....
Please cut and paste where I made you look bad with your pc.
Not reading well can be dangerous.
Waiting for a constructive answer from you. (as if it would ever
happen anyway, ouch mean here again. sorry. Get me pissed off for some

stupid shit. That's all I can come up with. I am not the brightest in arguing, so don't expect more from me. And most likely I will look stupid/dumb/pretentious/stubborn etc etc to you. Also, I don't have to prove anything to you or anyone else, Just that I generally say what I think, like it or not, doesn't make a difference to me).
Thanks.

New at Systems For Tomorrow October 29th, 1998
~~~~~~~~~~~~~~~~~~~~~~~~~~~

October Sale: It's the last few days! Check our web site for the sale listing! Orders must be placed/postmarked by/on November 3rd!

NVDI 5 for TOS Computers $99.99
The new English release of NVDI is here. A lot has changed with the new version. For starters, all the NVDI versions are combined into one. NVDI 5 can be used on your Atari system, or with Magic Mac or MagicPC. It also supports ET 4000, Matrix CX, Matrix TC, and Nova video cards! Also, new in NVDI is a huge selection of new Printer Drivers including: HP Deskjet 1100, 1120, 1200, 500, 540, 550, 560, 600, 660, 670, 680, 690, 820, 850, 870, 890, Cannon BJC 210, 240, 250, 4000, 4100, 4200, 4300, 4550, 4650, 5500, 50, 600, 610, 620, 70, 7000, 80, 800, 820, Epson Stylus Colo r 1500, 1520, 200, 400, 500, 600, 800, II, IIs, Pro, Pro XL, Photo, Photo 700, Atari Laser, Epson FX/LQ, varios HP LaserJets, and more. As usual, this new versions also provides more speed and compatibility then ever before. Note: NVDI ships on HD disks. If you need DD, please add $5. Upgrades from NVDI 3/4 are available for $44.99. From System Solutions.
Full versions are already sold out! Upgrades are still available. We will have more full versions next week.

Upgrade instructions: Send NVDI 3/4 Manual and Disks to: SFT - PO Box 3034 - Independence MO 64055 - USA. Include $44.99 + $4 Shipping for USA, $7 for Canada. Add $5 if DD disks are required.

GEMTrade 2.1 for TOS Computers $19.99
GEMTrade will take a German document and produce an English alternative. It also includes a lookup dictionary to find the translation of a specific word. GEMTrade can even function as a module for the CAB web browser. German web pages can be instantly translated while on-line! New version 2.1 now available. If you purchased 2.0, please E-Mail us about the FREE upgrade!

Running for Falcon030 $29.99
Running is a 3D shoot-em-up in the tradition of Doom and Wolf3D. Features good graphics, smooth gameplay and enough enemies and weapons to keep the warrior in you happy. From Running Design Team.

Atari Compendium CD for TOS Computers $9.99
This one isn't new, but after being off the market for a while,
~~~~~~~~~~~~~~~~~~~~~~~~~~~

it's back with a super low price. Contains the text of the Atari Compendium book, plus tons of PD/ShareWare software. From the now defunkt Toad (RIP.) Or is that RIPIT.

Apex Media for Falcon030 $139.99
Apex Media has long been considered the king of Falcon art and animation packages. Now, we have finaly been able to receive stock again. Apex Media includes a full suite of drawing and animation tools, morphing, true color filters and more. From Titan Designs.

Apex Intro for Falcon030 $49.99
This little brother to Apex Media is perfect for the average user that would quite possibly never use all the features of the Media version. It still provides ample drawing and animation tools, but gone are morphing, true color filters and non linear drawing tools. Also missing is $90 from the price! From Titan Designs.

Crown of Creation 3D for Falcon030 $39.99
In the year 2060 the earth is in deadly peril. Two alien races threaten humanity. The only hope left is the newly developed LH14 space-fighter and you. COC-3D is a breathtaking true color space combat simulation that features outstanding Graphics, sound, gameplay and contols. Even has in film sequences. This is the best falcon game we have seen in a long time, quite possible the best ever! From RebelSoft.

ExtenDOS Gold for TOS Computers $39.99
The latest version of the best CD-ROM drivers! Now supports long file names, CD-R and CD-RW drives. Also now will save a CD-Audio track directly to your Hard Drive with most drives. We offer upgrades from ExtenDOS Pro for $25 with the return of you ExtenDOS Pro disc. From Anodyne Software.

CD-Write for TOS Computers $39.99
When combined with ExtenDOS Gold, and a supported CD Writer, this package will alow you to create your owen CDs! For Cubase Audio users this is a Must have! From Anodyne Software.

Pinball Dreams for Falcon030 $9.99
This Pinball game for the Falcon isn't new, but the price is! Pinball Dreams features four tables of pinball action. It comes with both an RGB and VGA versions so it will work on almost all falcons with a color monitor. From 16/32 Systems.

Desktop Solitaire 1.02 for TOS Computers $19.99
Eight Solitaire card games in a GEM friendly application. New version now supports most video cards in 2,4,16,256 and 24bit color modes. Also includes several bug fixes, and the abitily to redeal the current deck. Upgrade DTS 1.0 to 1.02 for FREE, or check out the new demo, on the Systems For Tomorrow web site (look under Kordes Development from the main page.)

Scribble Synth for TOS Computers $29.99
This program is a software-based sound synthesizer. Scribble Synth is a true additive synthesizer, but with a difference, You actually draw in frequency envelopes with the mouse! The results are quite amazing. Strange Sci-fi Warbles, time-based pitch and filtering effects, plus frequency modulated sounds are all possible. From Electronic Cow.

EC-909 for STe/TT/Falcon Computers $39.99
EC-909 is an analogue drum machine emulator for the STe/TT/Falcon. It features sixteen origional TR-909 sounds with various controls. EC-909 can create single bar patterns in real-time, and then export them into your direct-to-disk recorder or sample editor as AIFF or AVR format samples. From Electronic Cow.

MidiPlay $49.99
This is a player of MIDIFILE without additional hardware for the Falcon030!! It plays the MIDIFILE with digital sounds! Features: Play all the MIDIFILE following the GM norm * Up to 24 voices on an normal Falcon * Each channel have a dynamic polyphonic voice. * You can change the sound of current channel. * Function SOLO (play only the channel), MUTE (not play the channel). * Viewing of volume, information for each channel, bar, time, etc...

Live Machine $64.99
Live Machine is a D2D program for accompanying someone during a concert. Live Machine can be controlled by MIDI messages! For the Falcon030.

Also Available:
MIDI Arpeddiator $27.99 MIDI sequencer
Sound Chip Synth $19.99 Software synthesizer
Snippit Synth $29.99 Granular synthesizer
Atari Works $79.99 Easy to use home/office suite.
True Image $29.99 Image Processing Package.
Alien Thing (Expert) $19.99 Alien Blasting fun!
Desktop Solitaire $19.99 8 solitaire card games for TT/Falcon
All Things Falcon CD $9.99 Tons of Falcon PD/Shareware on CD
Hard Disk Sentry $39.99 Optimize that Hard Drive
Photo Show Falcon $9.99 View Photo CD discs on the Falcon
Card File 4 $29.99 Personal Information Manager
Moving Pixels CD $29.99 Software Collection /w sources on CD
ESG Clipart CD $19.99 IMG, CVG and GEM/s clipart on CD
True Paint $19.99 GEM based paint package
Plus about 400 additional products for your TOS Computer!

i just recently bought an IBM DHEA 6.4 GB and it works absolutely perfect.
any other drive i have (scsi and ide) produce a lot of errors when i run
my falcon on 40 MHz but not this one ! it is very fast, almost cannot be
heard and does not heat up.

1726. Atari 1020st and 520st for sale

>
> Me too, unless of course you want to talk about "men's things"!

Wozat (or rather - woz'em?)

I've now tried using a backup copy of drive C (where all my autoboot programs reside, including Sting and dialer etc.) which when I made the backup worked fine. Now it doesn't. This is _very_ odd!

Do any of you lurkers (sorry, interest parties) have anything to add (even if it's "well that's what's happened to us too").

Because I can no longer use Zetnet to log in, I can't collect any Zetnet email nor can I log on to any Zetnet conferences, so I don't know if any settings have changed and don't know about it. Could be an answer?

This can be done with Imagecopy - any recent version. Run it as a desk
accessory (renaming it to .ACC and placing it in the root of your boot
drive) and then press ALT-HELP followed by INSERT (or a right mouse
click) when you want to grab a screen and the mouse isn't available.
Previously you have to configure it for the image type (*.IMG is
probably best on an Atari) and set the paths, but it's quite easy and
quick to do,

Regards
Peter

I wouldn't have though so. Some people are happy to give their time
away, some people aren't, it is up to them to choose how much they
charge. Let's not pretend this is solid graft you do for selfless good
Tony, you do it because you enjoy it, you are proud of what you make and
would like to spread it around, great, good luck to you.

So if you are ignorant of what you are distributing that's OK?
BT charge 40 quid for 650MB of software not including media and make
profit on it, by you that's OK?
10 quid for 650MB of software including media is not on even if it cost
several hundred pounds to collect the software?

But it's fine seeing the buyer paying 4 times as much, still having no
media for the price and BT profiting from it?

> It is dissheartening to know you have slaved over a title, given it to

I suppose the thought of BT profiting and the buyer paying a least 4
times as much fills your heart with joy?

> You think thats OK to do.. I think it is disgusting.. we are not going
> to agree that FREEware and PD should be just that.. yes charge for
> costs.. but don't make PROFIT from other peoples work...

Someone always profits, you chosen that the someone is never you. Some
distribution methods are cheaper than others. We've 2 variables left,
how much does the buyer pay & who profits:
800 odd quid - PDL profits
40 quid (no media) - BT profits
10 quid - Atari fan and CD maker gets a few quid back on the hundreds of
pounds spend collecting the software and/or a few pennies for
his time.

The CD option sounds like the lesser of the evils to me.

> We are at loggerheads and the debate is at a stalemate..So shall we
> shake and call it a day.. or would you like me to go on and on and on
> and on.. I don't think either of us are going to give up :)

I'd like to go on and on until you admit I'm making some bloody reasonable points! What you want Tony simply doesn't happen outside of a few people who swap software between eachother (like I did for several years). Your arguments against a CD really are totally subjective, it's the difference between the cost of media and the selling price that just looks like it's wrong, you see 8 quid of money not being spent on raw materials and think "8 quid profit" which it really isn't, if I was selling floppies with your software on them for floppy+2p you probably wouldn't be anywhere near as opposed to it, despite the fact that the "profit" on that would be greater than the CD for the same amount of data.

Yet again you are completely screwing with your argument. Do they want
it to be free or do they just want it so that nobody makes a profit?
Unless you copy it from a mate it isn't likely to be free, apart from
that, getting the software by CD is about the closest they can get to
free. If I can get a wider audience for my program, the reciever gets a
new cheap way of obtaining it and the CD makes gets a quid or so for
their time then IHMO it's a win-win-win situation.

Yes I remember lame excuse 3, I thought it was reffering to other people making CDs. So you object to BT charging for it, people charging for a CD, people charging for it to be copied (PDLs) and even the PO charging to deliver it. If you stopped all those profiting from your work then it's not going to get very far, do you still have your programs on your website? If so then maybe you should remove them, someone will be profiting ever time they are downloaded.

1738. My last post here ever...

Newsgroup: comp.sys.atari.st
Date: 1998-10-29 00:00:00 UTC
From: mr_maddog@my-dejanews.com
Message-ID: <718s82lgl1@nnrp1.dejanews.com>
Source record: 91026

It is with deep regret that I will no longer be reading comp.sys.atari.st or going on #atari. In fact, I'm not sure if I even want to use any Atari software ever again.

Ever since I had the 130XE over ten years ago, I have been a staunch support of the platform. No other computer has had a fiercely loyal userbase and that has impressed me right along side the brilliant hardware and easy to use software.

Owning a STe during the first few years was a great joy because I look forward to the user group meetings, BBS calls, and of course ST Format. But over time all those things went away as the tyrany of Micro$loth spread across the computing world. Even after STF folded, Atari went bankrupted and even when I bought a PC competemible, I would still stand by the ST platform. And the Internet was my only link to the others who feel the same way.

But recently, there has been an elitist attiutde around here. Everytime I ask for help on running GEM programs and OS's on a PC (or any machine as a matter of fact), I've had nothing put critiques and put downs. Even the projects I had propose which would have been of some value were rejected and dispised. All you ever had been saying is go get a Milan even though I can't even afford to order anything overseas. I only gotten a PC just to help me get through going back to school and to work on some programming projects so I can get a job in the computer field. They made it the machine of choice, I didn't... And while they are people who bend over backwards to make emulators to keep the Atari platform alive even though they aren't Atari machines, they never gotten as much support around here. Even a Milan is useless without the GEM software and if nobody will support any effort to keep those programs in use on 'any' machine, then the whole platform suffers.

I'm not here to whine and cry and I don't care if I even get flammed since I'm not even going to come back. The main reason for my sticking by the ST platform has always been about the people. And if I can get no more support from the Atari community than I would from the heartless PC crowd...well then I have to say that it's not even worth it anymore.

Eric,
I haven't noticed any sort of elitist attitude in this newsgroup. Were the putdowns you experienced sent to you via e-mail or were these comments posted here? I haven't seen anything of the sort in this group.

In fact, there are decent people in this group who have gone out of their way to help me get started again with my Atari.

I also own a PC. A damn nice one at that. I think there is nothing wrong with that. I use my PC for the Internet, e-mail/newsgroups and gaming. It's a wonderful piece of equipment. My Atari is used solely for music and MIDI sequencing.

It is a shame the Atari isn't supported commercially in the United States anymore. But there is a plus side; when you find Atari related items, it's usually at a great price. Those "sophisticated" folks are dumping their Ataris for megabuck PCs and Cubase VST. I visit the Cubase NGs on a weekly basis and there is a sad state of affairs within that community.

It could be a hell of a lot worse. The 1040ST could become a "retro-machine" commanding megabucks on the second-hand market.

If you want to throw away your Atari shit and the Atari community then that's your decision.

I think you are wrong.

That sounds fair, considering the same setup new would be around
$1800.00 without the monitor. Falcons are going for around ~400.00
give or take $150.00 or so, and the NOVA card price has dropped, but
still are around $300.00, IF (big if) you can get the dealer to ship
it to you. Standard case, or re-cased machine (does the SVGA card hang
out the back in a box)?

Using the SVGA, they are probably both equally compatible. GEM
applications only. No older ST type games. With the NOVA disabled on
the Falcon, it becomes very compatible with ST games and low res
software. The Milan is much more modern, and looks to have a bright
future (in Europe for the time being). It will be a much faster
machine than a stock Falcon, and easier to expand. You can wait for
the Milan, and with all the goodies probably spend three times as much
(more for decent audio) as you would spend on the Falcon, or get the
Falcon and enjoy it for what it is.

But I would question the sale. If it truely has an SVGA card, then it
cannot have 14mb of RAM (unless it has one of many accelerators
installed) because the NOVA will only work with a 4mb Falcon......

Post some more details of the machine before you plop down your cash.

1747. Complete PD library for sale - last few days

Newsgroup: comp.sys.atari.st
Date: 1998-10-29 00:00:00 UTC
From: clive@lapd.demon.co.uk
Message-ID: <3641113a.1805323@news.demon.co.uk>
Source record: 91035

The closure of L.A.P.D. at the end of September means we have two sets of approximately 2,000 PD, shareware and licenceware disks each (all in large Posso disk boxes (included in sale)). One set is our masters for the library, the other is our back up copies. The disks are mainly for the ST but there is also a small Falcon library included.

Not wanting to see these lost to the Atari community for all time, we've decided to let them go for the highest bid received by midnight on the 1st November 1998. There's no minimum bid, so don't think what you can offer is no good - if no-one else bothers to bid, you'll get the disks!

Send your bids to clive@lapd.demon.co.uk

Visit http://www.lapd.demon.co.uk/ to see the full lists of disks included (go past the R.I.P. page and into the 'catalogue' section).

1. Library A (the master) is complete. Library B (the backups) has not been updated for some while so will have newer disks missing.

2. State whether your bid relates to library A or B or both. Or if you bid for A and fail, do you want the same bid making for Library B?

3. The successful bidder MUST collect the disks from L.A.P.D. We have no intention of attempting to pack almost 30 Posso disk boxes!

4. The odd disk here and there may be missing for various reasons (i.e. withdrawn by author, withdrawn by L.A.P.D., corrupted by the passage of time, etc.) The successful bidder must accept that L.A.P.D. accept no responsibility for this fact .

5. To the best of our knowledge and belief all of the disks in both libraries are in working order and virus free. However, in the event that the ravages of time have had a detrimental effect on any disk the successful bidder must accept that L.A.P.D. accept no responsibility for this fact .

6. If the successful bidder intends using any of the disks to start their own library, then it will be the responsibility of the new owner to seek where relevant the permission of authors for their work to be diseminated through the library. This is particularly important in the case of the Licenceware disks. L.A.P.D. cannot pass on this permission and make no implication that any permission has been given. As far as L.A.P.D. is concerned, the disks are sold for personal use.

> Anymore ideas?

If the connectors below the keyboard are firmly soldered to the board, your mouse cable is broken, either from the ST end, where it enters the connector, or the mouse end, where it enters the mouse. You should check each wire with a multimeter and see if this is the case. If you know which one's should be the horizontal ones, just check these.

From the mouse end it's a bit easier to repair. If you have found the wire which is broken, try to pull it out from the cable (just the conductor, not the shielding); usually it comes out very easily, as the break point is just a few cm from the end. Note the colours before dismounting! Shorten the cable by some 5 cm and re-fix it. The connector end is a bit more problematic, as you have to change the connector. The standard 9-pin D-connector has the mounting lugs for the screws, and is a bit lousy fit with the ST (it works, anyhow). Anyone know if a connector without the lugs is available somewhere?

Worst case is that the cable is broken in the middle. This requires a complete change, of course... I've tried to use a joystick extension cable, but these tend to be too stiff.

I guess that I wasn't the only one to mail you with a few questions, so fitting one to a Falcon that already has a Nemesis would be a good start I reckon :-)

Check out the Quick FAQ. NoSTalgia is freeware. Or you could look at the
MagicMac option.

Check out the Quick FAQ.

If the monitor is VGA, it will only be able to display monochrome
resolutions. For colour you'll need an RGB monitor or a TV.

The only suggestion I can offer is that you try downloading the latest
version from Roy Goring's site,
http://www.users.zetnet.co.uk/rgoring/support/
and compare your scripts with his.

Were you using PPP or SLiP ? There is a difference between the scripts.
I cannot remember if Roy explains it all, but mail me if you want more
details.

Alternatively, if you really want to get back to zetnet and cannot get
STinG working, you could try STiK.

I imagine you have checked the Auto folder order. Mine is so automatic
it changed its own order the other day and I had to re-arrange it !!

Cheers

Paul

1756. Re: Atari SX212 Modem

Newsgroup: comp.sys.atari.st

Hiya Alf,

I had a SX212 modem a while back. Unfortunately I believe you can use the same adapter as a 2600. Yep, it's a 1200 baud modem.

One interesting thing about that modem. A while back I connected an 800xl (which was connected to a 300 baud modem) and an ST to each port, doing so I was able to connect the computers. No phone lines, I just opened the line. I transferred files and stuff. At the time it was pretty cool. I just found it strange =)

Hoped that helped a little.
Amra.

Sorry to see you go, but I have not seen the "elitist" attitude around here. That's the same attitude tha made me abandon my Amiga 6 years ago; the users were rather obnoxious. You are very right that the users on the BBS's, Genie, and now the Internet have made using the Atari platform a pleasant and enjoyable experience that is also the reason I kept with the plarform. There are a lot of helpful users out there still, and I don't think the "elitist attitude" is as prevalant as you have experienced.

Good luck in school, and if you decide to make any new projects for the Atari remember the whole community would be grateful, don't be put off by a fewe snotty users.

Eric Noss wrote:
>I would like to know more about this myself since I'm attempting to do the
>same thing using TOSBOX (I have it configured correctly so it's running more
>or less as a TT clone).

Well that's interesting, because the recent TOSBOX on my machine
is exceptionally unstable, and my guess is that
the crashes I experience on it are possibly related
to the DOS mouse drivers I've fed it (at least the BOOM! comes at some
point when I move the mouse). The beta 0.9-something works fine
though, but it is far less compatible. Same thing from
the DOSEMU side. What's *your story?

I very much doubt if one can use a Minix partition with TOSBOX,
because it does its stuff mainly in the DOS domain and how do
you get it to recognize the Minix partition? Haven't tried this,
but if I were you, I'd be wary of any such thing. Have you
tried Gemulator?

AY

P.S. Sorry I can't resist this:

Take a deep breath, and count to 10, and now relax.
I've been reading this ng for some time now, and while I have noticed a few less than friendly posts, the posts for the most part have been frienly, helpful, and inteligent.
Don't abandon the platform over a few bad apples. Although the Atari market is very small now, it's still being actively supported in a big way.
Take care, and have a pleasant day.
Falcon030, 14mb ram, 540mb hd, 17" svga monitor, MagiC, Pagestream, NVDI, ExtedDos Pro, ICD HD utilities.

Sorry to see ANY Atari user leave the scene, but I don't think this group
is as bad as you seem to think.

Sure there are the occaisonal asshole popping up, there's a couple of
show-offs, and there's a couple always spoiling for an arguement, but the
overwhelming majority of people here from all over the world are helpful,
knowledgeable, humourous and all round good people.

I do understand the frustration you feel about poor feedback and
knockdowns, but us at Atari Computing experience similar things, but the
hassle comes from a minority, the majority appreciate what we do.

Just too bad that the majority are sometimes too quiet? ;-)

Kind regards

Mike Kerslake

I still have NEW power supplies available for the SX212 modem. You can have one for $5 plus shipping if you want one. I may also have a modem cable for the SX212 lying in the parts area someplace -- if interested let me know and I'll try to dig it out.

The MegaSTe came with or without an internal hard drive. The computer was identical, but the base model without the hard drive simply had an empty hard drive bay. To add a hard drive to the base model, you'll need the hard drive upgrade kit, which included the interface board (a simple plug-in board), hard drive bay cover with mounting hardware, and ribbon cable. I'm pretty sure I still have one of those lying around in the parts department if you should need it.

This seems a little stupid, I have read some followups to your post. I
felt the same as you did for awhile. And I bet you are mostly talking
about IRC aren't you? Cause there are some assholes on #atari. I don't
know if I have even talked to you on IRC but I would say I don't fully
agree with you cause when I see someone asking questions about emulators
on #atari I just tell them to join #emulator. Personally I think emulators
are for lamers who just want to play the old "kick ass" games. Try running
Cubase on an emulator... or try emulating MiNT. hehehe Anyway, I hope I
didn't piss you off but if I did oh well. Like Bengy said earlier
"Opinions are like assholes, everyone's got one"

Later Dayz!

1771. update for me

Newsgroup: comp.sys.atari.st
Date: 1998-10-29 00:00:00 UTC
From: petero@sidney.terrasurveys.com
Message-ID: <36389663.0@news.pinc.com>
Source record: 91059

I have had an Atari 520ST (with 4MB mem and a Megafile 60) for many years but have hardly used it in the last few and so I have fell out of touch with what superceded what and which is better.

I live in Victoria, BC, Canada and I have no source for Atari h/w or s/w.

Someone just gave me a MegaST2 machine with a Megafile 40. What is the difference between the MegaST2 and the 520ST? Will the 520ST be able to read the Megafile 40 and will the MegaST2 be able to read the Megafile 60?

Where can I find programs for e-mail, news-group-reading, web-browsing?0

Where can I buy a version of Empire from Interstel Corporation?

Thanks for the help,
Peter O.

> 60?

Apart from the case, the MegaST has a blitter chip (a sort of 2D
graphics accelerator), and 2Mb of RAM, a 720K drive a hardly-ever-used
internal expansion slot. The keyboard is also much better. That's all.

> Where can I find programs for e-mail, news-group-reading, web-browsing?0

<sing-a-long-mode=ON>

In the Quick FAQ... http://quickfaq.atari.org/

<sing-a-long-mode=OFF>

> Where can I buy a version of Empire from Interstel Corporation?

Ugh ?

2nd hand stores ? Newsgroups ?

Cheers,
Nick

>GEM..
Well Very interesting all that, however you have to understand the
other side:
people are investing time/money/effort into making the atari a viable
platform, going FORWARD.
Making an STLOW STOS application is to me going backwards, or just to
please the old atari users. Nothing wrong with that, but even that you
didn't find get any good feedback, otherwise you shouldn't have cared.
So, seeing that doing STLOW application NON compatible with more
(d/r)ecent machines couldn't please anyone. don't be surprised.
2) If you don't get any positive feedback, you have to know why you're
doing it.
I got bad replies on some of my projects. (freegem for example). So
what? I see why people don't like it etc. If I don't agree with that,
I stop this particular project. (which I did). Same for UNiC.
However it didn't stop me to do some other project (which are quite
appreciated actually). like POPgem. Got several paid registrations for
it even.
Some people are trying to brake their ass off to make atari just "OK".
Initiative like Milan, all the openGL projects, MiNT, new protocols
like olga, bubbleGEM, etc etc. That's what really important to me. I
will support by any way what I can.
But hey? can't run all that on your 520ST. Ouch getting elitist
here...
Not, getting real, you told me there are more active 520ST user than
anything else. with NO harddrive. I couldn't believe you. Well it
might show I was right after all. There are indeed more 520ST machine
sold, but they are all in the closet while the pc or whatever other
machine is really used everyday.
By doing only 520 ST games not compatible with new machines. you are
already getting elitist in the way that the 520 is plenty, a wonderful
machine, that you don't need a falcon or hades as your 520ST can do
everything you want. (not even stating that you have a pc).

>Yes exactly what happened to me.. this is exactly the same.. it is
>dissheartening to try to make ATARI programs to be attacked by as you
>say the elitists who buy these big fancy ATARI clones then cry at us
^^^^^
Big fancy atari, hmm I can not believe this, and YOU talking from your
PC? I guess you run 320*200 in 16 colors on your PC?
What's fancy about the latest big atari?

Anyway, sorry if I piss some people off here, but I can't let this go
like that, I had to say what I was thinking.
I am sure mrmadog and tony will answer very promptly, bashing some
crap on me, or whatever, doesn't matter. Be real, hey we're on atari?!
can't be real anymore?

kellis, certainly not ready to enter an era ruled by pc or 520STf no
harddisk.

Thanks for listening.

Roger, congrats! A real machine at last... :-)

What's in it? RAM, card?, etc. Old type with metal shielding or newer one?
Is the CPU made by Motorola or Intel (...!...)
Got the PTC1426 with it (or a TTM195) or SVGA?

Just curious, also about the price :-)

My 64 megs TT-RAM expansion is due next week (at last!). Perhaps you're
interested in an Atari board with 16 megs?

I did have it at 1st set up for 4 500meg sections, but I ran
into a trouble, after copying about 100megs of files over to it,
I started getting a dilog box that said something about not able
to access, tos termatate operation. So I moved stuff back onto
the 548 drive and repartitioned it into 250 meg sections and now
everything works fine. Go Figure and this was all with ICD Hard
Disk Driver 6.5.5.

Yes, it's a kind of 68882 emulator. Its emulate the not in the 68060 CPU implemented
floating point routines.
It can be found on the homepage of Thorsten http://www.pils.de/~sven/

Be aware that for some reason MiNT kills FPU__3.PRG if runs before MiNT.
Therefore one must laod FPU__3.PRG once more from mint.cnf.
I for instance load FPU__3.PRG as first prog in auto and then runs it once
more from mint.cnf (exec c:\auto\fpu__3.prg).

Hi

I've got to add my pennies worth.

Like life there are always folk around that believe that they ahve the best machine money can buy, in whatever computer format you can imagine. Personally speaking, if I listened to the pundits, I would have packed the Atari field in a very long time ago. Now I spend as much time as I can in helping peole and their Atari's to live on; yes there is life after Atari (or should I say Hasbro).

I've only been reading this newsgroup for about a year now (happy birthday to me.....), and I've not noticed any elitist postings, that doesn't mean they aren't there it's just I've never come across them.

Any project that's meant for an Atari emulator or any Atari at all has to be beneficial to Atarians.

May I , on behalf of this newsgroup, wish you all the best fort he future.

Current Zyxel external, active ISDN TA's / modems support it on their analog ports.

Caller ID on analog lines rely, if I'm not mistaken, on certain DTMF signals. On ISDN, the D-channel is used to transmit Calling Party Numbers (pretty different). Which is why many a PABX or ISDN modem does offer CallerID of digital sources but not so on analog (because the co-transmitted DTMF signals are left alone).

What I would like to know is how to apply Malicious Caller ID.

I had to send dozens of faxes and mails, place tons of phone calls to find out anything about CID. Dutch Telecom people do not have a lot of common knowledge to these subjects, you're sure right about that)-; I could fax you a copy of the response I've received, if you're interested in that.

I would imagine that the Dutch telecoms provider has matched the CallerID signals of its American counterparts, but I'm not sure.

It's different for GSM also.

Would be interesting.

Hi everyone,

Just a quick note with a bit of begging!!!...

Issue 16 of the Atari Times (UK) is due for release in mid November. So far I have some really good articles for inclusion, but I am pretty disappointed at the overall number of contributions...

If you can help by contributing to AT, please email me as soon as possible :) The deadline for submissions is 10th November...

I'm interested in including articles on any Atari platform from the 8 bits to the Jaguar and the latest clones so if there is anything you can do to help please don't hesitate to contact me...

What's in issue 16 so far?

Atari STacy
The first part of a new HiSoft Basic guide
Web page reviews
Lottery Companion review (I hope!)
Men at War review

There are some articles still being worked on :)

I'm looking for news, reviews and even features so please, if there is anything you can do please mai me!!!

Cheers,

Date: 1998-10-29 00:00:00 UTC
From: tj@oro.net
Message-ID: <tj-2910981141310001@i391.oro.net>
Source record: 91078

In like new condition. Originally house the 44MB Syquest drive with ICD controller. Right now have a 400MB SCSI drive in it connected to my Mac. Will sell for $49 plus freight for the case with lighted front on/off switch with internal power supply and SCSI cables. You provide the hard drive and external SCSI cable to connect to your own system. Can also sell with 400MB HDD for extra $$.

Just 2+4 Mb.

>card?, etc.

No, nothing fancy like that :-) I could really do with a decent
graphics card though.

>Old type with metal shielding or newer one?

I have beeen inside and don't remember any shielding.

>Is the CPU made by Motorola or Intel (...!...)

Eh!! You gotta be joking. Intels are for the neanderthals.

>Got the PTC1426 with it (or a TTM195) or SVGA?

I'm just running a Trust SVGA ATM. Not the best but all that 680x400
deserves.

>Just curious, also about the price :-)

With a 850Mb HD it was 300 UKP.

>My 64 megs TT-RAM expansion is due next week (at last!). Perhaps you're

Why do it so awkwardly? Isn't it enough just to run it after MiNT in
the auto-folder? That's what I do with Motorola's 6882-emulator on my
Afterburner.

Believe me if I had anything useful to add then I would!

I've had my share of problems getting internet software up and running
(with Zetnet) but nothing like your problem, and I'm now working fine.

I'm using a Falcon with Sting (PPP), Newsie 0.92 and CAB 2.5. If you
want any of my scripts then I'll gladly mail them to you.

Chris.

I for one doesn't want an application that needs a spesific resolution, if it can't run on my graphics-card under N.AES together with the rest of my system then the application is pretty useless for me. If it's a friendly GEM-application then I might use it (I don't know if I need such an application).

If you're asking for opinions then you must respect the answers/suggestions you get. If you don't want to make it a clean GEM-application, fine, go ahead, but beware that you are excluding the only growing user-base, namely those that's investing in newer machines or MagiCMac/PC. But it's your choice, do whatever you want.

Just remember that the only way of making software that *everybody* can use is to use GEM properly.

> But to see this ranting.. to see you make pathetic attempts to point
> out I own a PC... well to say I am suprised is an understatement..

I'm sick and tired of your ranting and attempts to make your opponents look ridiculous. You're SHOUTING, using "Hahaha!!"s, "Hoh"s, "Duh"s etc. and never tries to actually *debate*.

> I make software that runs without any fixing or backwards on falcon

None of your games that I tested last winter worked on my Falcon with Afterburner and graphics-card (no surprise, very few games do), if you make your applications with the same tools then don't attack me for suggesting that GEM might be a better choice.

Werner,

it is indeed... especially when the KPN jerks don't know nothing about
it...

Got some info from Christian Andersson, where he says indeed the CID
should be analog DTMF signals sent before the first ringsignal.

Now he talks about Powerbit modems, which can handle this thru' a range of
AT#CID commands, where:
CID0 turns the CID off,
CID1 is CID on, info is sent "formatted" before the first ring;
CID2 is CID on, info is sent "unformatted" before the first ring;
CID3 is CID on, info is sent "formatted" after the first ring;
CID4 is CID on, info is sent "unformatted" after the first ring.

I guess these Powerbits are analog modems. So if they are, how about other
modern analog modems?

All you see in the stupid adds is "V whatever compatible", fax class
"don't give a shit", but nothing on CID support...

I could subscribe to CID with KPN, but if I can't buy a bloody modem that can handle the stuff it's useless. And I don't need a stupid KPN model telephone capable of showing me the stuff, or another bloody box that can, I've got this computer running that should do the trick and do it better than any g.dd.mn KPN hardware...

But all the wizkids can say is "I don't know, Sir"... Jeeezz!!

Tell you something else: I've been plagued by this so-called "Fax-terror" for more than a year now; bloody phone rings, you pick up and all you hear is "prrrrrtt, prrrttt, prrrrttt, wheeeeee!". 5 times on another, etc.
One day, next day, 3 days not, then again, two weeks not, then 3 days in a row again etc.etc. Usually I came home from work and found the bloody answering machine filled up with that crap. So I called "KPN-Service" in February and they put me on the monitor. "Give us a call whenever it has happened again, Sir, and we'll check the computer who it was".
OK, fine, hook me up please.

No more terror until somewhere in September. Two or three times and I called the number again. "Hey guys, it happened again, so who's the bastard?".
"Well sorry, Sir, but this service has been moved to another place in Holland, so please call them on nr. whatever".
Fine, called the number and asked "Who da fuck is p..... me off here?"
"Sorry Sir, you aren't hooked up to the monitor ever since they moved the service...".
So I said, "Nice going" and they offered to hook me up for another week.

Well, you guessed it, no more plaguery up till this day.

I'm just wondering, who is terrorizing here??????????????????

Maybe U was wondering why I want this CID on my computer here... :-)

Hi,

due to lack of time to use it, I'm selling my 1040STfm. (spanish
keyboard)

The "/" key in the numeric keypad is broken but easy to fix.
I built in a blitter chip for graphics and so on. It can be turned
on/off from the menus.

The best offer before 30.11.98 (including P&P) wins.

Mail your offers directly to me!

Cheers,

Martin

Definitely not.
Sometimes someone comes around with cracked versions but they are
never really cracked. Always there are things that make them do
nothing any more or worse they bomb out.

Never found a realy full-working cracked version of the stuff.
Maybe nice for someone who never uses the full program to its full
extend.

Hardware upgrades have improved greatly over the last few years, but prices
are still a bit high. Faster speeds, 020 and 030 upgrades, and coprocessors,
video cards, etc.. Not a very cost effective way to go (I'd get a used
Falcon for that), but entertaining.

That was the situation with Bob Wakelin. When I interviewed him he told me
that he ran his own studio and when Ocean came along he was commisioned to do
the covers as a freelance.

However the work from Ocean kept coming so that for a while 80 percent of the
illustrations he did were for Ocean. He also did 3 covers for Computer & Video
Games!

Bob Wakelin is the artist who illustrated nearly all the covers for Ocean software between 1983 and 1994. His work includes the covers for Rainbow Islands, Match Day 1 and 2, Parallax, Head over Heels, Parasol Stars, Chase H.Q., The New Zealand Story, Hyper Sports, Pang, Where Time Stood Still, Moon Alert, Operation Thunderbolt and Target Renegade.

Now he is selling the original one of a kind artwork for selected titles. Details (and about 30 box scans) can be found at:

http://retrogamer.merseyworld.com/wakelin.htm

An interview with Bob Wakelin can be found in the current issue of RETROGAMER fanzine (number 18).

You lose all info on the partition you initiate Minix on
remember that you can not have minix on drive C:
I am using Minix on one of my partitions on my hades 060 without any problems
and minix is very stable.

sounds interesting Benji - if you do decide to go through with it,
I'll certainly alert the members of TAF that there's a new boy in town
(well, in the entire country :)) and we would certainly check on you
for what you'd be carrying and at what price.

so, where in Canada are you located? And what items are you
planning to be representing and selling? One thing you might consider
would be becoming the new Canadian agent for Atari Computing....

Hi there.
No, everything I have tested work very well.
Sometimes some software falcon only might not like the new TOS patched
with the FASTRAM. So disable the FASTRAM (a tad slower coz fastram is
MUCH faster :) but still everything works at 50Mhz. the Game RUNNING
for example, the 50Mhz is not a problem, the game is VERY smooth, but
would be even better if FASTRAM could be used with this game. I hear
the RUNNING people were gonna try to fix their game for FASTRAM. I
don't know. we'll see..

>reckon :-)

Well I didn't have a nemesis so, it's hard to comment on that.
However from what I understood, If you have had a nemesis previously
fitted in your falcon, installing a ct2 will be faster than if you
didn't have any card before as when you've installed the nemesis, you
had to make some modifications that the ct2 also needs, So half of the
job is already done. especially the dsp track to cut and such.

|> Minix compatible) and how to set them up under MiNT 1.15.

You don't need to reformat your HD. And I just don't know how you could do it ;)
You just need the prg minit.
You'll lose everything that is on your partition.
The Minix partition is very stable and allows permissions. This is very
useful if you have a multi-user system, well as long filenames (you can choose
between 14, 30, 62 at the installation with minit)
ATTENTION, your boot drive (usually C: MUST *NOT* be a Minix partition)
Minit is a .ttp program. You can run it from normal tos. It requires several
parameters which I don't remember (I let the KEMD installation program set them
for me ;)).
When your Minix partition will be installed, you'll need a minix.xfs to drive
it. (XFS = eXtended File System). You can get them from many ftp sites. The
0.7 one is the latest and works like a charm. You'll have to put it in a
C:\MINT\ directory (or C:\MULTITOS\, it also works).

In your Mint configuration file (C:\MINT\MINT.CNF) you'll have to set
an environment variable called UNIXMODE. It will describe the way long file
names will be converted when copying/moving/etc to a TOS partition (short
file names).
as an example :
setenv UNIXMODE \brUs.
a documentation exists about this environment variable (ftp sites)

If you use the standard desktop, you'll probably have problems as it only
knows short file names. You should get Gemini or Thing, and a good file
selector. A very good one is Freedom (shareware). Another one is BoxKite

If you are frightened buy all this :
get the KGMD package, with the KEMD v2 archive on Katherine Ellis' homepage
http://www.primenet.com/~kellis
unzip the kemd and follow the instruction.
The KGMD will install a complete Unix-like environment, with Minix partition,
multi-user, and (if you want it) network, X11, programmation tools (gcc ...).
After the installation, if you decide to keep only the minix partition
management, just delete the rest ;)

Any problem -> email me :)

Vincent

Hm, i also have my 520 left. This machine does what they do.
Works nice to burning eproms, test other ataris and save the
life as terminal for my dmm.

>I live in Victoria, BC, Canada and I have no source for Atari h/w or s/w.

Hm, i know. Thats not funny. Use the post service?

>Someone just gave me a MegaST2 machine with a Megafile 40. What is the
>difference between the MegaST2 and the 520ST? Will the 520ST be able to
>read the Megafile 40 and will the MegaST2 be able to read the Megafile 60?

Well, the biggest difference is the case and the extra keyboard.
All other does the same as your 520. Hardware internals are nearly the same.

Your Megafile devices are only differnent in voloume. Both use the same
driver (AHDI i think) and the same DMA connector. Watch out!
DO NOT REMOVE DMA PLUGS WHILE THE MACHINES ARE ON! (Damages DMA Chip)

Your MegaST2 have 2Meg RAM.

>Where can I find programs for e-mail, news-group-reading, web-browsing?0

Yes, that's hard without WEB, FTP and some other sources.

Some Atari Software CDs contain a part of atari internet software.
Otherways, take it from an bbs with atari software or ask anybody
to send the packages as email. (You got realy big emails :>)

Someone copy the archives to 720K disks..

The cheapest way i think is to take CAB, STinG, aFTP, NEWsie..
Works fine on any atari.

>Where can I buy a version of Empire from Interstel Corporation?

Sorry, i don't know.

1828. APE for the ST

Newsgroup: comp.sys.atari.st
Date: 1998-10-30 00:00:00 UTC
From: Trystan Negus <tnegus@matra.co.uk>
Message-ID: <71cquf$2n5$1@guardian.matra.co.uk>
Source record: 90916

For the Atari 8-bit there exists a program called APE which enables the Atari to link to the PC via the serial ports (using a suitable cable), and effectively use the PC as a direct filestore (using disk images and so on). Is there a similar utility available for the ST? It seems a shame to let my PC's HD get filled up with MS bloat when I could use it for much more useful and entertaining things.

Thanks in advance,

Trystan

Looks to me as if he is mad because someone is going to recoup
some money for their time and effort in collecting and making the
CD. Case in point. I just paid $39.95 for the 6 CD set of Linux 5
when the program is free ware and I could of got it from the
internet. Question is why did I pay for it? Convince that is
why! By the way you choose to place your works as free ware. You
could of chosen to go Shareware. Problem is that alot of the
stuff that is free ware / shareware or whatever isn't really
things that one really needs or is that isn't always well thought
out or has BUGS or incompatibilities with one machine or another.
Personally I do not mind paying a fair price for ones labor
whether or not they write the programs or they make cd's of
programs from the internet as long as their work is of quality.

so much for my two cents........

Exactly (or almost) what I, and everyone I knew were saying when I began writing Cobol programmes in 1956 when our humungous 16K beast which filled almost a floor in the office building was installed and it took 10 passes, with plug refit before each pass, to run a simple accounting programme.

>

Sorry for being late :-(

I've only just picked up this thread.

You can still pick up your mail from zetnet while using Freeserve :-)

Just change the mail server address in newsie :-)

When you logged onto Freeserve, did you change anything other than the
scripts?

I have successfully used both Freeserve and Zetnet from the same Atari, all
I did was wrote new scripts and saved the Zetnet ones, and reinstalled them
after.

BUT I did it in Everest, not using dialler.

If you are still having trouble, please ring me 01705-611847.

Yours Roy

Hi

There is it's called Ghost link and allows you to access any of the pc's drives via the ST. Apart from theprogram, you need a standard null modem cable.

Logic only runs on certain TTs. It works on one of mine, but not the
other. The reasons are unknown in that both machines have the same
motherboard revision.

I'm afraid you're wrong at this point. I've been using an Epson ET6500
scanner for years on my printerport of my TT030. Right now the same
scanner hangs on the printerport of a Hades 060.

I know that my Atari-dealer had to do something inside the TT030 to make
the scanner working but I can't recall me what he did. It took only a few
minutes so it is probably not a big job.

If it's only for the long files names then there is no need to have a
minix partition because freeMiNT 1.15 can handle VFAT and FAT32. I use it
on some partitions of my harddisk.

1847. FS: Atari Jaguar pin $3.50 includes postage

Newsgroup: comp.sys.atari.st
Date: 1998-10-30 00:00:00 UTC
From: tj@oro.net
Message-ID: <tj-3010981529480001@i380.oro.net>
Source record: 90935

I have a nice 2" x 3" Atari Jaguar pin that must of come from some Atari show in the past since it says "get bit at booth #6030". It is all black with the typical Jaguar logo which has the yellow eyes, the red Jaguar name, and say's "64-bit". So for collectors of Jaguar stuff, you can add this to your collection. Can be mailed in a bubble-lined envelope in the USA for $3.50. That should cover the postage and the cost of the envelope in the USA. Obviously not looking to make a profit for it so rather than throw it away, I bet someone wants it. Let me know.

I made up some extension cables from ribbon cable. This stuff can flex quite easily and also does a good job of bringing the mouse and joystick ports out into the open where you can get at them. I just bend them under the machine and out the back of the STe.

The SX212 is a standard 1200 Hayes standard modem except that it has the
connector for Atari 8-bits. Plug it in, run your terminal software and
you're off! (Although at 1200 baud, I wouldn't recommend using it for
anything besides text).

Kev, that's way too cheap! Remember, this is *ANTIQUE* software, I recall
the version cost 600 dollars at the time. That should be doubled by now
because... it's ANTIQUE... special offer to hackers only: "double price".

So, Mr. Ziethen, I've got one copy for US$ 1200 especially reserved for
you, and I'll crack the dongle free!

I've had similar problems. Used to use STIK. Switched to StinG, worked
fine until..one day..same as you describe. My provider tells me 'has
switched to a faster upstream provider' Can no longer log on with
StinG. Back to STIK. No problem. Examination of Log In (using Connect)
reveals a change, Mersinet now gives me an Annex address as well as an
IP address. What is an Annex address?

Well, I seem to recall this name... errm, wasn't it calling Uwe Seimet to
"fuck off because of...."??????

Well, what da fuck we think we're doing?

Trying to keep a bunch-a-freaks together, that's what we're doing...

If one feels pissed off, is that my fault? Anybody else's??
Maybe yours??? I get the impression he was fucked off on IRC, not here!
Several people in HERE told him "why?" (note BIG question mark)

Someone suggested "does it originate from IRC?"

Got some feeling this #Atari is crap, CRAP, C-R-A-P! Jerks that hide
behind fakenames, "for Chrissake, don't mention your real name" and try to
impress others with crap.

You wanna know one (ONE) reason why I'm not on #atari????? See above!

And sorry for the decent ones, but that's a ratio of 1:25...

Well, if Mr. Maddog chooses to stay away from here I just have to respect
that. I got some feeling however he decided on that using other means of
connecting to Fellow-atarians... My thoughts, anyway.

As far as my experiences go, #atari's not worth connecting to. Well, I had some informative stuff on a separate #Milan or whatever, but that was on occasions only.

Hi Mave. Which emulation are you using in your BJC210?. I wrote to canon support and at first receive the same ignorant answer as you. Then, after asking further, a kind knowledgeable person gave me a complete list of escape codes. I haven't done many tests yet because currently I don't have the BJ05 cartridge, but I can dig in the docs and send you the right codes. Do you have NVDI?

Regards,

DAniel.

I will budge if I think you make a decent counter argument to the points I raise but it seems that for the most part you snip them or sweep them aside branding them childish, silly or whatever without backing it up.

> read the above... I never run away from a debate as the regulars like
> yourself know.. but I do have enough sense to see when it can't go any

I think it is an interesting debate and it could go much futher, I'm not so sure if it will. If you feel it should end then it *is* within your power to end it.

You do it again, you say it's far fetched and silly yet is is quite clearly happening! I gave some distribution methods and prices which I thought showed reasonably clearly how each party benefitted from each method and it said to me that a CD is one of the better options, you just cut it out and ignored it. It's not so much a case of if they can do it why can't I, it's a case of you seem happy to let them do it, why not me?

> Sorry but I find those
> sort of excuses a little far fetched....like moving the goalposts

> cost.... hey then thats ok!

I arguing on both points, your original post claimed I would be making a profit on a CD, I say that there has been a lot more money paid out in real cash in order to get to the stage where I can make the CD on the other hand I am saying that I believe my time should also be classed as a cost.

> Why don't you put it clearly.. either you are making a profit from
> other peoples FREEware and PD or you are getting back the cost of the
> CD...if the latter then I don't have a problem as explained.. if the
> former then you should be burnt at the stake....mate :)

I'm surprised you are willing to let me claim I spent several hundred quid to get the software in the 1st and accept that is a cost. I could claim the same for my computer & the CD-R, without them, I would not be in a position to make the CD either.

1862. EZ230 Problem

Newsgroup: comp.sys.atari.st
Date: 1998-10-30 00:00:00 UTC
From: cmassey@gate.net
Message-ID: <71bae5$1lsq$1@news.gate.net>
Source record: 90973

I have been using an EZ135 for sometime now on an STe and moved it to my new/used TT in the past year. It has been a joy and I make fast backups to my important info and also use it for my music projects.

I have been helping a new computer user that picked up a Mega 2 STe and I thought it would be a good idea to pick up one of the EZ230's at the blowout price of $80. It has been a near nightmare.....

When I opened it up, I found that Syquest had changed the SCSI connector from a 50 pin Cetronics to a 25 pin. Since I had to use the Link2 on the Mega, the search was on for for a 50 pin female Cetronics to 25 pin male. It took me 3 weeks to get the correct cable-this includes 2 cables that were shipped that were mistakes.....

When I finally got the proper cable, I hooked it up and the power supply was DEAD! Syquest shipped me a new one at no charge, of course.

Finally, we are up and running. I used the ICD Pro Formatter to format and partition the cart and all was well. Then I started moving files and folders to the 230 and checked a few text files and all was well. Then data started getting trashed. I ran Diamond Edge and there were many lost clusters and FAT 1 did not match FAT 2-(I haven't a clue as to what this means).

So, I called Syquest and they cheerfully told me to box it all up, ship it to them and they sent me a complete new kit.

Last night, I fired it up on my TT, instead of hauling it to my friends house 18 miles away, and it was the SAME situation..... The only difference was that I was not using the LINK2 and came straight from my Quantum SCSI.

I tried moving data by clicking and dragging, using Maxifile and even turned off the cache. I am out of ideas.

I did not terminate the EZ as I had no terminator (remember the 25 pin problem) but I figured since the TT recognized the EZ and was able to format/partition and actually move a few files correctly that termination is not a problem-True or False????? <g>

I have a call in to Syquest Tech but haven't heard yet.

Any ideas?????

Moral: No good deed goes unpunished! :-)

1866. Re: Is Linux fully compatible with Unix, and how dioes it act with WINlo

Newsgroup: comp.sys.atari.st
Date: 1998-10-30 00:00:00 UTC
From: Alexander Yakovlev <ayakv@glas.apc.org>
Message-ID: <APC&63'0'5b6bee45'eed@glas.apc.org>
Source record: 90977

Linux, essentially, *is* a version of UNIX, with some Linux distributions
adhering pretty closely to the POSIX standard of UNIX systems.
As for interacting with Win...something, well, it's like a grownup to
a kid. Linux can read the VFAT and FAT partitions that punk Win hangs
out on; there are also two or three Win emulators on Linux, which generally
can't run all Wingrrr software, especially if that is 32-bit-based,
but otherwise do a pretty good job.
Linux is an amazingly stable and rock-solid OS. I have used it for about three
years and (believe it or not) have not lost a single file on it. It has
crashed on me a couple of times in these three years, but there was nothing
I couldn't iron out in 15 (!) minutes by "curing" the file system.

In my view Linux is the only good thing which has happened to the
PC world in the last few years.

AY

P.S. But learning UNIX involves a veeeery steep curve if you never
worked on it... Worth every second of the learning, though...

I know the feeling, I had to first find a hard drive that used the 50pin
Centronics, then I attached it after that using the connection they gave me
too. Now I use it with the right cables.

>When I finally got the proper cable, I hooked it up and the power
>supply was DEAD! Syquest shipped me a new one at no charge, of
>course.

That was very nice of them to do that.

>Finally, we are up and running. I used the ICD Pro Formatter to

I would try and re-format the drive, it should work, that is what I had to do
when I had the 230mb EZ Flyer and now it works fine.

>So, I called Syquest and they cheerfully told me to box it all up,
>ship it to them and they sent me a complete new kit.

They actually heard of people using it on the Atari?

>Last night, I fired it up on my TT, instead of hauling it to my

You should NOT need to terminate it, they automatically terminate if there is
NO device after it, or is that the model that has the switch?

: Why do it so awkwardly? Isn't it enough just to run it after MiNT in
: the auto-folder? That's what I do with Motorola's 6882-emulator on my
: Afterburner.

Unfortuneately this program contains more than just an fpu-emulator, there
are also various tos-patches for the hades included, that's why it should
be startet as soon as possible.

Hard disk drives usually are not ATAPI devices. (I never heard of an
ATAPI hard disk drive.) Other IDE devices usually are ATAPI devices.
An ATAPI hard disk drive (if it existed at all) for a Falcon would be a
bad choice since transfer rates for ATAPI devices connected to the
Falcon are not as good as with IDE devices.

I realize this is probably wishful thinking, but couldn't we please stop this argument ? This forum is starting to look like fr.comp.sys.atari with all the flaming.

Tony, maybe you should realize that you're being annoying. Trying to have the last word is hardly a constructive attitude, especially when isolating a phrase or two out of there conext and adding "duh!". We all know how much time and work you've invested in the Atari platform, so there's no need to brag about it.

As for the others, well, maybe we should all calm down a bit. Our community is really too small and fragile to cope with this sort of dispute. This sort of flamewar is pushing people away from our platform at the very moment when we should try to be attracting new users.

Just my csas-regular mandatory 2 Euros.

Cheers,
Nick

There's no chance in running a parallel port scanner on the Atari's
parallel port, because it is missing some signals. This is the same
reason parallel Zip drives will not run on the Atari's parallel port.
It's not a driver issue.

There are some drivers for SCSI scanners around, but rather difficult to
get hold of. Parx used to write them, but they've folded.

Cheers,
Nick

You CAN'T connect a parallel Zip to the Atari's parallel port.
You CAN connect a parallel Zip to a cartridge port adapter from Germany.
You CAN connect a SCSI Zip to a SCSI host adapter on the Atari.

This is all in the Quick FAQ

Cheers,
Nick

I have to say that your "hu" and "ho" and "sheesh" and "duh!" and
"hahahaha!!" and SHOUTING and... etc. etc. make me feel like talking
to some w****r who does everything to say that I must be an idiot to
have the opinions I have, and that there's no way in hell I can
convince you. Much like kids who stick their fingers in their ears and
shouts "NANANANANANA!" when they don't want to listen.

So why do I involve myself in these threads all the time then? I must
be an idiot after all.

Seconded from me :-)

0.92 has successfully downloaded the fullgroups listing for me and it
sorted fine - that's one big problem fixed :-)

The only problem I'm still seeing is the nicknames one - two bombs - but
John's aware of that from reading the docs, so hopefully a cure soon. I can
still edit the nicknames file manually and get it working, so no major
problems really.

Well done John! :-))))

Kind regards

Ask WB-Systemtechnik / Germany.
They sell a smal empty board. You need a 16MB PS2 Simm.

http://members.aol.com/wbsystem/index.html

Also you can try wizztronics, titan design..

Terry May (outrider@lvdi.net) wrote:
: On Mon 26-10-98 19:15, Katherine L Ellis scribbled:

: >VFAT GEM prog might have prob as much as on minix. no difference here.

: Not really. Most programs will work even with VFAT enabled. For
: those that don't, it can be turned off temporarily, very easily.

I have yet to meet a program that doesn't work on a Minix partition, but
maybe that was just some chance good luck.

: You missed the point. The point was the ability to have long
: filenames, etc., without having to use special partitions. But if
: MiNT can do the same thing, then I misunderstood. I guess the point
: would be that VFAT has some advantages over minix, rather than over
: MiNT itself.

In fact I would suggest that Minix would be a much better choice than
VFAT. The only reason to use VFAT is so that you can still access the
drive under plain TOS without MiNT or MagiC running.

Well if all your software works on the Minix filesystem anyway, you have
no need to switch back.

As for FAT32, this is the craziest idea. There are really no advantages in
using FAT32 and VFAT. It's still just as kludgy and unreliable as FAT16
and VFAT, still suffers from the same problems of unreliability of FAT16.
And you get no backward-compatibility. Why would you want FAT32? I can't
imagine why.

A Minix filesystem, on the other hand, will be faster and much more
reliable, not to mention many more features like file ownership and
permissions.

Unfortunately this isn't as simple as just wiring it up. Designing such an interface is quite a job.

Fortunately I'm currently working on a suitable interface which will be available soon.

It lets you connect any AT keyboard and any serial mouse to the ST, TT, Falcon or compatible machines.

The interface will include support for mouse wheel for scrolling windows, and other unique features.

I will announce the interface in this newsgroup when it is ready.

on Sat 31-10-98 10:04 Paal Monstad wrote:

>What is the advantage/disadvantage of using VFAT/FAT32 instead of a
>minix partition? And where do I find the VFAT/FAT32 program?

VFAT is implemented in the freeMiNT 1.15 kernel. Just use lines like this
in your mint.cnf

```
# NEWFATFS= enables the new FAT filesystem driver for selected FAT
# filesystems. The old TOS FS will be used otherwise.

NEWFATFS=A,D,E,J

# VFAT= enables VFAT extension for selected drives specified in the
# NEWFATFS= command.

VFAT=A,J
```

I suggest you read the docs of MiNT 1.15. Everything is explained.

As for FAT32 there is a small utility to create such a filesystem. I think
you can find it under the name *mkfatfs-0.2b.tar.gz*
It should be on ftp.funet.fi pub/atari/piwo-mint.
It's certainly on the Belgian ftp-site 193.190.205.13 probably in
atari/incoming/mint/filesys.

I'm really not entitled to point you out the advantage/disadvantage of
VFAT/FAT32. I'm just a common user of MiNT with no knowledge of
programming or the way MiNT works.
There are guys who will do this in my place I guess.

The mean reason why I use it is because I can have long file names on a
normal TOS partition or floppy. This means for instance that I can have
long filenames on a floppy which can be handy if that floppy comes from a
pc or need to be readed on a pc.
If I for some reason have to use plainTOS I still can read that partition
without any problem.

Glad to hear you are considering opening a new shop. As with any new enterprise, if you can sell more than you spend you will make a few bucks. Micheal Dell started building computers from scratch and built a 12 billion dollar company. Apple and gateway have similiar roots. Atari itself was once just an idea. Bad management killed Atari. For example, I just found out that after ten years of using ST's, that Atari also made PC compat's. How many hundreds of thousand of former Atari users are using PC's now. Atari could have become another PC clone maker just by letting users know that they made PC's. Revenus from the PC side could have subsidized the Falcon and Jaguar and new products. The bottom line is if you feel you can do it, then go ahead. I personally think that there is a strong need for someone in NA to import all those cool ST and Falcon upgrades they make in France and germany.

As a sales professional, the only real advice I can give you is that the majority of people don't buy what goo or even what they want; they buy what they are told to buy. Only a handful of people will actively seek out their own choices. If you tell everyone in Canada to buy the new Atari hardware many will buy and you will make a fortune.

Good Luck

B.P.

I've had an EZ230 hooked up to my STe and now My Falcon because my
Jazz died on me. I have had no problem at all. I believe the EZ like
the Jazz is auto terminating. You may have a problem with the SCSI
ID. I remember reading somewhere that the TT030's SCSI considers the
TT itself as a SCSI device

On 30 Oct 1998 03:05:41 , Charlie Massey wrote:
>

But I can :-) If you have a Falcon or TT, and a PC with SCSI-disk,
then you can share this disk directly via SCSI. FAT32 has advantages
over FAT16 on large partitions, so supporting it on MiNT (or MagiC for
that matter, but I don't think MagiC supports it yet) makes sense
IMHO.

Not wondering at all. Having the same problem. Problem is - I need MALICIOUS caller ID since the people who seem to be calling have their numbers blocked...

But if you're interested I could at least fax you or send by snailmail (sorry scanner not hooked up yet) a copy of what they told me about it. I've also asked them about DSL readiness in the Netherlands. They don't know jackshit 'bout it as usual. Until I made 28 thousand phone calls.

Okay, this is the final day for entries into this months DarkForce!
Prize giveaway. We are offering the following prizes this month:

1) 4 copies of ST-Plus magazine

2) 1 6 month/3 volume subscription to Atari Computing

3) 1 Chro-Magic RamGizmo Falcon Ram board, fully populated
with 16 megs of Ram

Don't be shy - one single phone call to our BBS puts you in the
drawing for one of these prizes. You can't win, if you don't play
though! (darn, I sound like one of those Lottery commercials!) ;-)

Best of luck to all that call... ;-)

Winners will be announced on the BBS, and to comp.sys.atari.st on
Sunday... Thanks...

1912. Music (heavy metal / hardrock) reviewers wanted

Newsgroup: comp.sys.atari.st
Date: 1998-10-31 00:00:00 UTC
From: karies@wxs.nl
Message-ID: <363d4707.19364312@news.wxs.nl>
Source record: 90873

First of all, perhaps an apology is in order for this message perhaps being a bit off-topic. I will be posting this message with some regularity, so please contact me if you think I ought to steer clear of this newsgroup in the future, and tell me why.
Anyway...
I run a web-based review magazine of books, films, software and music called "W3M3". I am looking for capable writers of English to write reviews in any of these categories. If you feel like helping the magazine out (http://www.scriba.org/w3m3) feel free to contact me (karies@wxs.nl). The writer's guidelines can be found on the site as well. All authors will be credited, of course.

The music section is already the most extensive of the magazine (over 100 reviews and almost 20 music-related interviews), but still I think it can grow a lot. I cover a lot of prog/death/doom/guitar myself, but there are so many bands it boggles the mind. If you have a recent CD that you'd like to write a review of, just go ahead and do it.
And...perhaps superfluously, the magazine is slanted towards heavy metal kind of music. Doom/death/prog/heavy/black/thrash/speed are most welcome, as well as quite a few other categories, but grunge (for example) I'm afraid is not what I'm looking for ;-)
Hope to hear from you soon.

>

Werner,

don't expect this.... yet! I read about people in Germany having taken a
case to court: they argued that when the phone companies offered CID, you
should also be able to BLOCK calls from people refusing to send their ID's.
Or to put it slightly different: one should be able to require his phone
company to block all calls without ID! Don't know what the outcome is, but
if the court goes along with that, it won't take long before we follow in
Holland...

The next thing I'm wondering is: what happens when you finally find out
who the bloody caller is that insists on getting through; suppose I get a
dozen more calls from this "prrrrtt-prrrrrrrtt-wheee!" caller and I manage
to identify his number. Would KPN take action? Shut him off? That would
mean loss of income for KPN! I'm not too sure about what legal action one
can ask/demand to be taken.

Regarding your malicious callers I'd say they intend to be malicious,
since appearently they deliberately block the transmission of their own
ID's. As long as we don't have any jurisprudence on the matter over here,
I fear you'll have to "get used to it"... :-(

When I'm at home when it happens, sometimes I just pick up the phone and
put it beside the phone for an hour or so. At least it gives me the
"satisfying feeling" I'm screwing their phonebills :-) Only hoping the
connection will last that long.

Gonna e-mail you my snailmail address separately, just curious as to what
KPN had to say on the matter :-)

What ever happened to free enterprise.
If someone wants to put in their time and effort to try and produce
a CD for the benefit of the Atari comunity, we should applaud them.
If they want something for their efforts, so be it.
If anyone thinks they are charging too much, well then we each
have the freedom of choice to decide whether or not to purchase
the CD.
If anyone producing the CD does not conform to acceptable pricing
levels, they will be stuck with a lot of CD's.

As for anyone not wishing to have their software on the producer's CD,
let them know they do not have your permission to include your product.

As far as Freeware Vs Shareware, that topic is self explanitory.
Free is Free. Shareware requires some commitment if you use the
software and expect support.
The producer of the CD is not selling the software, but only the
effort required to produce and distribute it.

```
These items gotta go!!! I need the space!!! They goes
as follows:

Hardware: All with Manuals

* Atari 1040STf (1 Meg)/Broken Keys but still works ..... $ 25
* Atari SM804 w/Outburst................................. $225
(Needs new drum and toner)

Hardware: No Manuals

* External disk Drive (Needs Power Adapter, Radio Shack) . $ 10

Software: All With Manuals

* Easy Draw ............................................. $ 10
* Degas Elite ........................................... $ 10
* Typesetter St ......................................... $ 10
* Stalker/Telecommunication Software ..................... $ 20
* G+Plus ................................................ $ 10
* Migraph OCR/Optical Character Recognition Software ..... $ 10
* Mr Boston Official Bartender's Guide ................... $ 2
* The Juggler ........................................... $ 5
* Geneva/(Multi Tasking Program) & NeoDesk(Desk Top Prg .. $ 50
* Hyrid Arts Semte Track w/sync box ..................... $ 75

Software/No Manuals:

* Hybrid Arts Ludwig Music software ..................... $ 3

Games: All with Manuals

* F-15 Strike Eagle Flight Simulator .................... $ 10
* Elite/A Fantastic Voyage .............................. $ 10
* Defender Of The Crown/Knight Fight .................... $ 10
* Knightmare/Knight Fight ............................... $ 10
* ShadowLands/Barbarian Fighting ........................ $ 10
* Barbarian/Fighting .................................... $ 10
* Lemmings/Maze and Building ............................ $ 10
* Ultra V Warrior of Destiny/Knights .................... $ 10
* Baby Jo/Baby Super Hero ............................... $ 10
* Drakkhen/Dragons ...................................... $ 10
* The Pawn/Good and Evil Fight .......................... $ 10
* Dragon Of Flame ....................................... $ 10
* Breach ................................................ $ 10
* Time Bandit ........................................... $ 10
* Quest Glory ........................................... $ 10
```

* Romancing The Throne ..... $ 10

Games Disk only:

* Dragon Master ..... $ 5
* Rambo 3 ..... $ 5

Programing Software & Book Combination:

* Mark Williams C Compiler/4 Disk/ and Update (2 Disk)
Mark Williams C For The Atari ..... $ 25

* CSD C Source Debugger1 Disk
Mark Williams CSD C Source Debugger For The Atari ST ..... $ 20

Programing Books:

* Prospero C, Language, AES Bining, Library, VDI Binding . $ 25
* Atari ST Internals/The Authoritative Insider guide ..... $ 10
* Atari ST Graphics & Sound/Mastering Capabilities ..... $ 10
* Peeks & Pokes/Hidden Secrets with in the Atari ..... $ 10
* Atari ST Application Programming ..... $ 10
* Atari ST Gem Programmer Reference ..... $ 10

Software Books with no Disks:

* Mark Williams resource Editor For The Atari ..... $ 3

Good observation - I'll put that to the Y2K team at work and tell them
to relax :)

Does this mean that there is a Y2K bug in the year 2000?

My apologies to anyone confused. I wrote the above paragraph and somehow failed to delete the two lines attributing the previous message in the thread to Paul.

_I_ think that the debate is getting repetitious. Hopefully my comments (now correctly attributed) might convince the "warring" parties to call a truce (or at least go to email). I think I've read 40 posts about this!

Have you looked on the UTSI audio/midi page ?

```
------------------------------------------------------------------------
------------------------- AUDIO/MIDI -----102-----
------------------------------------------------------------------------
-numbers-
* 525 *
-a-
* AKAI SYS EX * ANALYSER/EQ 2.1 update * APEX AUDIO demo *
* ART OF NOISE DSP PLAYER * AUDION *
* AUDIOMASTER demo * * AUDIOMASTER 2.03 update * AUDIOMASTER 2.03NP update *
* AUDIOTRACKER demo * AUDIOTRACKER 1.66 update * AVENA SOUND SYSTEM *
-b-
* BACKGROUND MUSIC UTILITY * BACKGROUND PLAYER * BINARIS MOD PLAYER * B.P.M *
-c-
* CD PLAYER * CD READER * CD RECORDER AUDIO demo * CD RECORDER PRO demo *
* CD RECORDER 2.18 update * CDREADER * CREAM PLAYSID FALCON *
* CREAM PLAYSID STE * CREAM PLAYSID ST-STF-STFM *
^^^^^^^^^^^^^^^^^^^^^^^^^
```

Perhaps is it what you are looking for ... but
of course I don't try every program I link to
the UTSI :)

From: tom.derrick@acpu.com
Message-ID: <912144268@acpu.com>
Source record: 90795

fletcher@liv.ac.uk (David Fletcher) inquired:

F > The cursor only moves left when I move the mouse left or
F > right, its not a virus. Any ideas how to fix it?

I am sure that the other suggestions you received are quite valid,
but...
Whenever your mouse starts acting funny, check your power supply
voltage. When the PSes start putting out less than 5 Volts, it can
cause mouse slowing or stoppage.

"The Poor Deluded Soul" - tderrick@acpu.com

I used tosbox in the past and got some TOS images from the web, but there
is a program that will take "picture" of your own TOS Chip. That means it's
your's in that it doesn't break copyright...or so I was told. I got the TOS
image generator from one of the web pages dedicated to Atari emulators.

>
>Anyone???

Vaguely I remember that German firm that had software for the Falcon
to make it an automatic telephone answer- and recording machine.
You know also with: 'press button 4 if you want information about...'.
Also there was a BSS-system connected with it.

The latest update of the stuff had 'caller id' so depending on who
phones in the Falcon could adapt to the caller.

In case there is a need for Word Perfect:

WP-Conversion

files from 1 st Word and WordPlus 2 and 3 made on the Atari

are converted to and from

Word Perfect 5 format.

Another version TWP does WordPlus 4 and 5 and That's Write.

But maybe Word Perfect is dying out...

Yes, is possible. The Falcon also has a nearly-modern PC printerport.
When they went using the printerport for bi-directional they first
took 4 handshake lines to transport data (nibble-mode).
Lateron they put some extra lines in and made the data come in/out
trought the data-lines.

So question: old scanner: ok but new scanner?

I think that what the things have in common is: power use.
Also moving mouse or setting him/her on an answer-box seems to to
ask for more power (at least in my TT with Calamus there are
situations where I can hear strange sizzling noises come out of the
TT-box). My guess is: powersupply.

Hi. I don't know too much about the Atari ST Operating System but I do remember that it was one of the earliest GUIs along with the Macintosh System etc. I'm researching for a talk entitled "Human User Interfaces: Past, Present and Future" and would appreciate some screenshots, pictures etc of the user interface in action, especially very early versions, or any other information about early Atari ST systems.

Please feel free to mail me gifs, jpgs etc as I have a direct connection and can cope with big files easily.

Cheers,
Tom

Rite, I know it's off-topic but according to some PC-users I know, Word is
a lot more user-friendly than WP.
OTOH, WP 7 got a port to Linux... I'm pretty sure ole Bill won't allow
that for Word :-)

1945. TAF MonSTEr Flea Market November 18th

Newsgroup: comp.sys.atari.st
Date: 1998-11-01 00:00:00 UTC
From: dreibel@idirect.com
Message-ID: <363c9368.0@nemo.idirect.com>
Source record: 90809
Cross-posted to: comp.sys.atari.st,comp.sys.atari.advocacy,comp.sys.atari.8bit,alt.atari

Subj : TAF Flea Market November 18th, 1998.

WEDSNDAY, NOVEMBER 18TH, 1998 is the date for another popular
Toronto Atari Federation FLEA MARKET! The doors open to
the Public at 7:00 PM and runs to 10:30 PM.

Yes, here's your chance to come to a bazaar of Atari-related
software and hardware where you can shop for that peripheral
or application for your ST/TT/Falcon or 8-bit that you've
been looking for. Or, if there's stuff that you have no
use for, get yourself a table and sell! Get rid of your
old stuff or find yourself a treasure!

A Half-Table costs just $5.00, Full-Table just $10.00 each.
A Half-Table is FREE to TAF MEMBERS. (Dealers are expected
to contribute a little more <grin>), with entry to the Flea
Market at $2.00 per family (Free to TAF Members).

The Flea Market itself will run from 7:00-10:30 PM (with
setup commencing after 6:00 PM and teardown at 10:30PM).
This should allow enough time for as many people inside
and outside Toronto to show up.

As usual, piracy cannot and will not be condoned at a TAF Flea
Market - anyone caught selling pirated software or stolen
hardware will be dealt with severely!

Please refer to the bottom of this document regarding getting
in touch with TAF on booking tables or finding the location
of the event - and we'll see you there!

The TORONTO ATARI FEDERATION Flea Market will be held in the
Gold Room of the North York Memorial Community Hall on the
Lower (or Concourse) Level of the North York City Centre
Library Building at 5110 Yonge Street at Parkhome Avenue.
Parking garage inside the complex next to the Novatel Hotel
Those using public transport can take the TTC's line to the
North York City Centre Station and walk through the tunnel
into the concourse, down to the food court, turn left and
find the Memorial Hall.

That's Wednsday, November 18th, 1998, 7:00-10:30 PM for the TAF FLEA
MARKET.

Hi all,
Please order 5ukp min, or it's going to cost me
more to P&P. Collect and no min amount.
All original, no copies. Price in tasty uk pounds, includes P&P
in uk.Swaps encouraged.

Hardware bits n bobs-
Mouse/joystick cable ext (pair) one is a ROBOSHIFT autoselect
thingy with pretty red/green LED's. Allows mouse and joystick on
mouse port, no more bent pins. 2.00

AlfaDATA real time clock cart + software (ok on my old STFM,
can't test as upsets the Falcon&STacy internal clock) 2.00

STFM to VGA monitor cable (inc seperate audio output jack) works
with _most_ VGA monitors. ?SVGA, god knows, a gamble. 2.00

Atari software=
serious(ish)-
MULTITOS (Highsoft boxed version 4.0) 4.00
DA'S VECTOR 9.00
EASY TEXT PRO 2.00
HOMEPAGE PENGUIN PRO V2.5 5.00
ULTIMATE VIRUS KILLER v6.6 1.00
CALLIGRAPHER PRO (inc manual, font & grammar disks) 9.00

games-
ATARI GAMBLER CD (Falcon and TT games CD) 10.00
POWER UP (overhead racing with track editor) 3.00
FLIGHT SIMULATOR TWO 3.00
LLAMAZAP (Falcon only Minterblast) 5.00
PRINCE OF PERSIA (platform classic) 1.00
TEAM (football, like sensi but? faster. STE/Falcon) 3.00
SHADOWLANDS 2.00
SECRET OF MONKEY ISLAND (adv, nice graphics) 5.00
WIZKID (strange, frantic, good) 3.00
LEISURE SUIT LARRY . . . LOUNGE LIZARDS (animated adv,
works in mono-high and colour res) 4.00
MACH THREE 1.00

JAGUAR STUFF, all boxed, *= no manual
All include P&P in uk.

DRAGON: BRUCE LEE 4.00
IRON SOLDIER* 8.00
FEVER PITCH SOCCER 8.00

RAIDEN 6.00*
RUINER PINBALL 6.00
SYNDICATE 6.00*
POWER DRIVE RALLY 6.00
ZOOL2 8.00
BUSBY* 6.00
VAL . . . SKING&SNOWBOARDIG* 6.00
CHECKERED FLAG 6.00
RUINER PINBALL 8.00
ALIEN V PREDATOR 8.00
CLUB DRIVE 6.00
WOLF 3D 5.00
TREVOR MCFUR 5.00
WHITE MEN CANT JUMP* 6.00

Would swap any 3 for -WORLD TOUR RACING
or SUPER BURNOUT or MUTANT PENGUINS
or MEM CART.

Regards, Steve

The biggest reason that Atari didn't push their PeeCees here in
the US is that they didn't qualify with the FCC. The Atari PC2
and PC4 never got a FCC identification. I have only seen the
Atari PC2, which came from Canada. I can tell you for the money
spent I wasn't impressed.

IMHO Atari was much better off designing and producing the
ST/TT/Falcon computers

David.

I would like to know why in the modem world it is impossible
to ship computer items between the US and UK?

Could it be the exchange rate, the postal rules...what?

It does not seem to be an impossible distance.

Velma,

Are you talking about hardware or software? Hardware going from the US (export) can be subject to various gov't regulations regarding the exporting of defense or "cutting edge" techology, however there should not be a problem with importing computer hardware (I am not real sure how Atari computers would fall into this catagory :)). The real problem is the cost of shipping one item vs a container full. It normally is not economical to ship just one or even a few.

Regards,

Steve Hammond

STalker is a bit long in the tooth now. How about using Connect? This shareware program has been released as freeware now, and has a 95 version available and a 97beta available too. The archive has a password generator so that you can register it yourself.

I can report that it works great with a Falcon!

Cheers!

It sounds like you need a better cable. The ones that Syquest sent with the ez135 were super; but it sounds like you obtained another one. I'll bet that it is terribly inferior. If you don't spend serious money ($30-$60!) for a scsi cable between your TT and an external drive, you might as well not have the external drive. Trust me.

1955. some MagiC/Thing setup questions

Newsgroup: comp.sys.atari.st
Date: 1998-11-01 00:00:00 UTC
From: dreibel@idirect.com
Message-ID: <363cdc26.0@nemo.idirect.com>
Source record: 90819

Now that I'm using MagiC as my main operating system, I'm searching more into adding all sorts of power features together on my desktop. And I have a few questions to see if I can get a number of options together....

1) I've registered Stewart, and now I want to set up the Icon Manager to handle all my icons on my system. However, I'm also using Thing as my desktop (which I've also registered). Is there any way I can set up STiC and tell Thing not to be the application to handle my icons? Is there anything I have to remove from the Thing ICONS.RSC file, or do I have to remove the Thing Icon Manager?

2) I'm taken with the look of MultiStrip and I'd like to use it as my launch/terminate/freeze function - however, it has a tendency to lock up my Falcon! Is there anything I need to configure and eliminate from my Start folder to ensure MultiStrip works? If not, I'll stick with Appline, as it appears to be way more stable and has never locked up.

BTW, I've written an article for the November PHOENIX on my experiences so far in setting up my desktop, and I hope it'll be good for TAF members to get an idea on just how powerful MagiC actually is.

|System etc. I'm researching for a talk entitled "Human User Interfaces:
|Past, Present and Future" . . . .

When Apple introduced their first window/icon/mouse computer (the Lisa I think?) there was an article in Byte magazine discussing the research they did to establish the most 'natural' interface. I suppose this was some time in the early 1980s. I used to have it but gave away all my old Bytes to the local university library some years ago.

I presume you know that Apple did not invent the mouse/arrow etc? Xerox did at their research facility in Palo Alto or some such place.

I am not certain what the best method of selecting from the menu bar is. I don't like the Atari method of automatically showing a menu when the arrow enters the menu area AND having to click to lose the menu again. It would be OK if the menu disappeared when the arrow moved off it. Also the double click is a bit of a pain. Perhaps left down followed by right down could be interpreted as a double click? Also, in the Hades at any rate, opening a folder with a double left click sometimes selectes the file/folder/program lying under the arrow in the open folder. It ought to wait for button up before waiting for the next button down.

I know of no reason why you shouldn't. The sender has to complete the appropriate custom's forms and the shipping agent in the UK bills you for the taxes due. At least that's what happened when I bought my DirecT60 from Canada.

You would have to watch out for mains voltage and line frequency etc.

Can't suggest anything about termination.

But I make this suggestion: when you next format/partition a cartridge,
run Diamond Edge over it and create Mirrorx.DAT and SCSIx.DAT files
both _before_and_after_ using it. I also suggest, if you use more than
one cartridge, saving the relevant DATs in separate folders named for each
cartridge and mark each cartridge accordingly, eg: 1, 2, 3,..., on
the edge label. Don't mix them up if you need to restore, or you'll
lose your data: believe me :((

Good luck,
Charles.

Hello MagiC users,
I have split up the download bay into several sections, much like The ultimate Tos Software Index.
2 if the new sections include:
Alternative Winframes: Currently only has 2 in this section, but more are coming shortly. These are of use to MagiC 6 users only. On my page there are snaps of these if you are not sure what im talking about

Themes: Ok, So far only one, and its a new Idea in the MagiC world. The archive contains Rsc files for Start me Up, Appline and a winframe.rsc All these rsc files have a common look to them. As well, there are Background pictures and windows pictures (for Jinnee users) in the archive. Soon hopefully their will be a GEM installer which will copy all these files to their appropriate locations and allow easy management of different "themes".

Note that I will be holding a contest soon to see who can come up with the most original winframes and the most original theme set.

thank you,
Bengy

1966. MiNT is beating MagiC in the O/S poll

Newsgroup: comp.sys.atari.st
Date: 1998-11-01 00:00:00 UTC
From: Bengy Collins <collins@bulli.com>
Message-ID: <363D1544.5906F91@bulli.com>
Source record: 90830

Well in a surprising turn of events, MiNT actually overtook MagiC in the
OS poll, it seems as if almost overnight!
And this is *on* a MagiC support Page too :-) Boy there's lots of MiNT
users out there..
Anyways, here are the current results:

MagiC (92) 33%

Single TOS (35) 12%

MiNT (Geneva/MiNT, N.AES, MultiTOS etc)
(99) 35%

Magic MAC (16) 6%

Geneva (18) 6%

MagiC PC (13) 5%

STonX, WinSTon, GEMulator, PacifiST, etc (8) 3%

LINUX/M68K (2) 1%

Total Votes: 283

Take care,
Bengy

I felt exactly the same way. However, it locks up here on my TT, as well.
I'm sure at least in my case, at least, it's a lack of being able to read
the German docs 'cuz from the number of folks using the program, it
certainly must work. :)

>
I have used the same ezFlyer on both my MSTe and TT. On the MSTe I
connected via the SCSI port on a Supradrive without problems.

The ezFlyer is Auto-terminating, so there are no termination problems
on the MSTe, (unless you have other devices in the chain) because the
internal drive is on a different SCSI chain. However, on the TT, the
ezFlyer is on the same chain as the internal drive and, if you do not
unterminate the internal drive you will get data errors all over the
Syquest, and if you are unlucky, the internal drice as well.

Be very careful about termination when connecting external drives to
the TT's SCSI port.

[snip]

Well we have a club member who uses one, he uses a ribbon cable with the suitable SCSI connectors on it so the plugging issues are sorted out. His problem was he had a commercial 25 to 50pin cable with different pinouts on the cable, be happy you didn't have this problem! The Link2 heated up a great deal. All is well now with a new cable.

The problem you describe may be related to termination, and you should establish clearly how it is on or off, whether there is a switch, jumper auto or whatever. You must know its status, and try it both ways.

I personally have a Syquest 270 removable and have had to return it *THREE* times. Indeed, I knew more than the Syquest agent in this country, because I got a friend to telephone the factory in Singapore. THis is where I found out they were having trouble and there were many dud drives, so I could tell the local rep a thing or two.

I don't know if the 230 drives are known to have problems, but it should work fine, like any hard drive should. Without hesitation, you should get a new replacement, with a new cartridge and very carefully start again and logically monitor and test different setups to make sure. Try it on several machines if you can, including a PC.

It is important to get it sorted. I know that my 270 is still a little bit flakey, they do cartridges in rather easily. I saw an article in a German computer mag, where they tested the drives *properly* and found that the sysquest 270 had been improved but still had problems. Its hard to find out definitive information that really covers in depth a customers hassle.

I have seen strange things with the TT030, its hard to know sometimes if every hardware is quite compatable with each other. Certainly the Atari SCSI is not great, I've had my share of ICD Link2 problems, I begin to think that the European Link97 is a more full implementation of SCSI and who knows if this helps in the equation when there are problems.

Either way, my advice is to insist on a new replacement, I know of people who have had to do this many times, until you strike a good one.

: What is the advantage/disadvantage of using VFAT/FAT32 instead of a
: minix partition? And where do I find the VFAT/FAT32 program?

If you use VFAT without FAT32, the advantage is compatibility with
original TOS. However if you use FAT32, then you lose this compatbility,
and there is no longer any advantage over Minix.

In that case you would be much better off with minix. While plain TOS will
be unable to access a Minix partition, it can't access a FAT32 one either.

And while FAT32 still contains most of the problems of FAT16, and VFAT
adds more problems, the Minix filesystem avoids those, as well as adding
many extra features.

Help! My SVGA monitor on my Falcon has lines going up it. The problem is not the monitor for sure. The problem seems to be with the Falcon itself :(It seems when I move the mouse or type it affects teh lines. Also when the hard drive is running the lines move. I have unhooked all devices and tried with only the Falcon and the monitor and it didn't help.
Does anyone have any ideas???

1977. Internet Program Idea

Newsgroup: comp.sys.atari.st
Date: 1998-11-01 00:00:00 UTC
From: nameerf@flash.net
Message-ID: <71gp58dmq1@excalibur.flash.net>
Source record: 90893

Here's something I'd love to see...

A program that, like Newsie for example, does most Internet functions (E-mail, FTP, Newsgroups, etc). This program however should be able to define other programs in place of these, in case the user prefers a different E-Mail program, or Web Browser to the built-in one. The program should also be able to have a user-definable menu of other programs (such as IRC, ICQ *when it comes out*, Finger, etc.) and be able to automatically run some of these programs.
For example, let's say I'd like to run the Program, have it automatically bring up the Sting Dialer, and once connected (it should automatically check for this) it runs POPGEM or other E-Mail program that can be kept running in the background to constantly check E-Mail while connected, and in the mean time, open CAB and a Newsgroup window. This way, I can constantly keep tabs on E-mail, look at newsgroups, and Browse the Web without exitting or running any additional programs.
Alternately, it could also just show a menu bar (or button window so it doesn't get covered my another program's - or maybe even a Windows '95-type button bar) from which I could easily select from any of these functions. Basically, it just unifies all the Internet software into one environment. Here's a possible menu:

```
+--------+
Name File |Internet| E-Mail News FTP Web Options
----------+---------------+-----------------------------------------
| Dialer |
| Web Browser |
| E-Mail |
| News |
| FTP |
| Finger |
| Forecast |
| HTML Editor |
+---------------+
```

String Server was suggested to me, but isn't quite what I'm looking for. I'd like something a little more elegant and as flexible as possible. For instance, I just want to be able to go to a list of Internet functions, click, and there's the display. This program could of course work WITH String Server to run these programs when a string in a file is clicked on. It should also run with OLGA, of course.

Anyone interested? Programmers, especially, but if you support this idea, any feedback will let me know I'm not alone, and would

show any potential programmers that there's interest! Thanks!

Mike Freeman

could it be that in the UK modems have to meet with BABT
approval from the British telephone companies before you can use them
on their lines? That might also have a bearing on why some companies
in the US may be unwilling to ship their modems to the UK.

That happens to be the one reason why I haven't done an article for
Atari Computing on the modem I currently use, my GVC 33.6 fax/voice
modem - a great little piece of kit made in Canada, and it works great
on a Falcon. Why do a review on something when the majority of people in
the UK and possibly Europe wouldn't be able to use or buy it? OTOH, the
Motorola 56K review they did made sense because it does have BABT
approval and you can buy it just about anywhere - and now come to think
of it, how about doing a followup review on the Motorola after it gets
its V.90 upgrade from its original Flex software to see just how well
it works with an Atari now?

As you've found out, there's now quite a lot of midi sequencers out for
the Atari market. I prefer Cubase (Commercial) but as it's not one of
those "get it on disk" programs, it may not be on your CD-ROM
